DATA MINING 2 Sequential Pattern Mining

Riccardo Guidotti

a.a. 2021/2021

Examples of Sequence

Sequence of different transactions by a customer at an online store:

```
< {Digital Camera,iPad} {memory card} {headphone,iPad cover} >
```

• Sequence of events causing the nuclear accident at 3-mile Island:

```
(http://stellar-one.com/nuclear/staff_reports/summary_SOE_the_initiating_event.htm)
```

- < {clogged resin} {outlet valve closure} {loss of feedwater} {condenser polisher outlet valve shut} {booster pumps trip} {main waterpump trips} {main turbine trips} {reactor pressure increases}>
- Sequence of books checked out at a library:

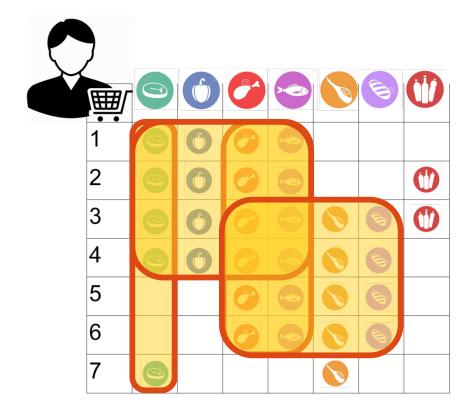

```
<{Fellowship of the Ring} {The Two Towers} {Return of the King}>
```

From Itemsets to Sequences

- Frequent itemsets and association rules focus on transactions and the items that appear there
- Databases of transactions usually have a temporal information
 - Sequential patterns exploit it
- Example data:
 - Market basket transactions
 - Web server logs
 - Tweets
 - Workflow production logs

Frequent Patterns

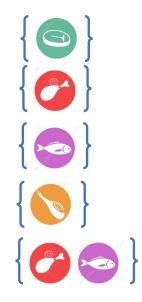

- Events or combinations of events that appear frequently in the data
- E.g. items bought by customers of a supermarket

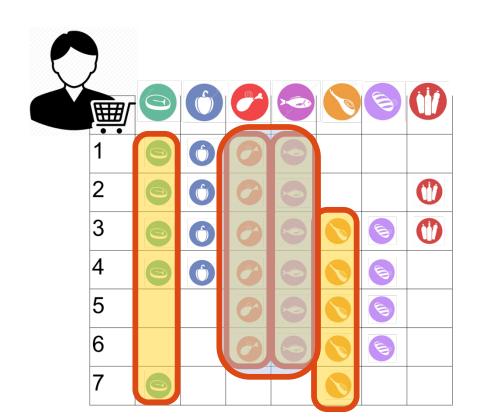

Frequent Patterns

• Frequent itemsets w.r.t. minimum threshold

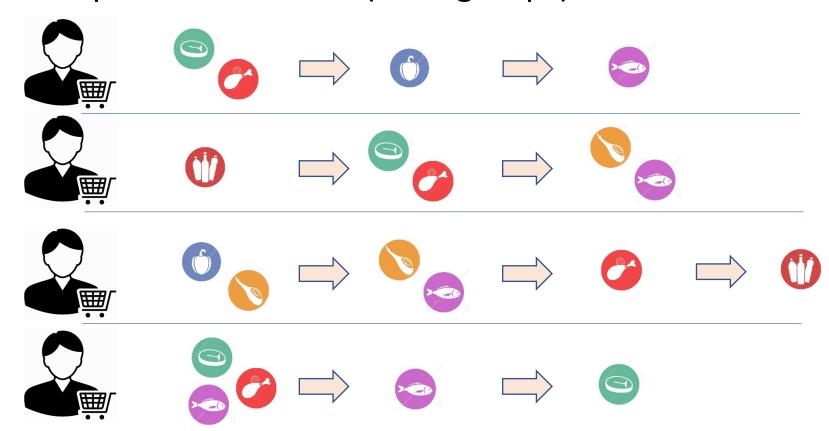

• E.g. with Min_freq = 5

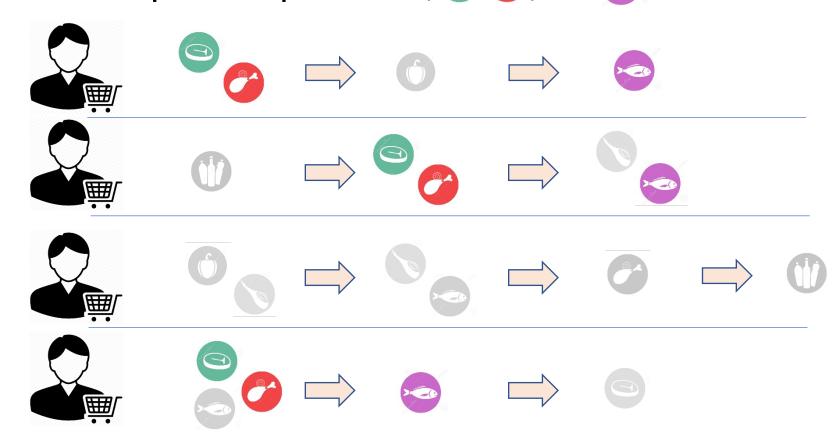

Frequent Patterns in Complex Domains

- Frequent sequences (a.k.a. Sequential patterns)
- Input: sequences of events (or of groups)

Frequent Patterns in Complex Domains

- Objective: identify sequences that occur frequently
 - Sequential pattern: { 🕥 🗁 🖒

Sequential Pattern Discovery: Examples

- In telecommunications alarm logs,
 - -Inverter_Problem:

```
(Excessive_Line_Current) (Rectifier_Alarm) --> (Fire_Alarm)
```

- In point-of-sale transaction sequences,
 - –Computer Bookstore:

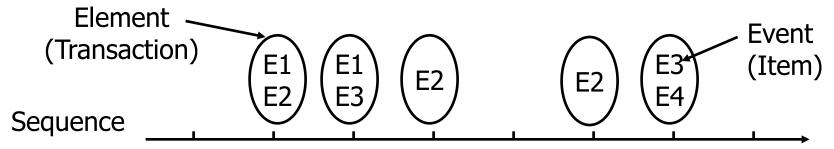

```
(Intro_To_Visual_C) (C++_Primer) --> (Perl_for_dummies,Tcl_Tk)
```

–Athletic Apparel Store:

```
(Shoes) (Racket, Racketball) --> (Sports_Jacket)
```

Sequence Data and Terminology

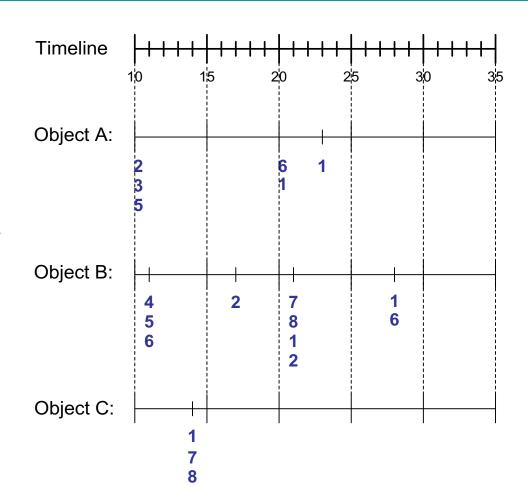

Sequence Database	Sequence	Element (Transaction)	Event (Item)
Customer	Purchase history of a given customer	A set of items bought by a customer at time t	Books, diary products, CDs, etc
Web Data	Browsing activity of a particular Web visitor	A collection of files viewed by a Web visitor after a single mouse click	Home page, index page, contact info, etc
Event data	History of events generated by a given sensor	Events triggered by a sensor at time t	Types of alarms generated by sensors
Genome sequences	DNA sequence of a particular species	An element of the DNA sequence	Bases A,T,G,C

Sequence Data

Sequence Database:

Object	Timestamp	Events
Α	10	2, 3, 5
Α	20	6, 1
Α	23	1
В	11	4, 5, 6
В	17	2
В	21	7, 8, 1, 2
В	28	1, 6
С	14	1, 8, 7

Sequential Pattern Mining

Formal Definition of a Sequence

A sequence is an ordered list of transactions

$$S = \langle e_1 e_2 e_3 ... \rangle$$

- Each transaction is attributed to a specific time or location
- Each transaction contains a collection of items

$$e_i = \{i_1, i_2, ..., i_k\}$$

- We "measure" sequences with two different notions:
 - Length of a sequence: |s| is given by the number of transactions of the sequence
 - Size of a sequence: a k-sequence is a sequence that contains k items

Formal Definition of a Sequence

Example

```
S = \langle \{A,B\}, \{B,E,F\}, \{A\}, \{E,F,H\} \rangle
```

- Length of s: |s| = 4 elements
- s is a 9-sequence
- Times associated to elements:
 - $\{A,B\} \rightarrow time=0$
 - $\{B,E,F\} \rightarrow time = 120$
 - $\{A\} \rightarrow time = 130$
 - $\{E,F,H\} \rightarrow time = 200$

Sequences without Explicit Time Info

- Default: time of element = position in the sequence
- Example

$$S = \langle \{A,C\}, \{E\}, \{A,F\}, \{E,G,H\} \rangle$$

- Default times associated to elements:
 - $\{A,C\} \rightarrow time=0$
 - $\{E\} \rightarrow time = 1$
 - $\{A,F\} \rightarrow time = 2$
 - $\{E,G,H\} \rightarrow time = 3$

Examples of Sequence

Web sequence:

Singleton elements

- < {Homepage} {Electronics} {Digital Cameras} {Canon Digital Camera} {Shopping Cart} {Order Confirmation} {Return to Shopping} >
- Sequence of events causing the nuclear accident at 3-mile Island: (http://stellar-one.com/nuclear/staff_reports/summary_SOE_the_initiating_event.htm)
- < {clogged resin & outlet valve closure} {loss of feedwater}
 {condenser polisher outlet valve shut} {booster pumps trip}
 {main waterpump trips & main turbine trips & reactor pressure increases}>

Complex elements

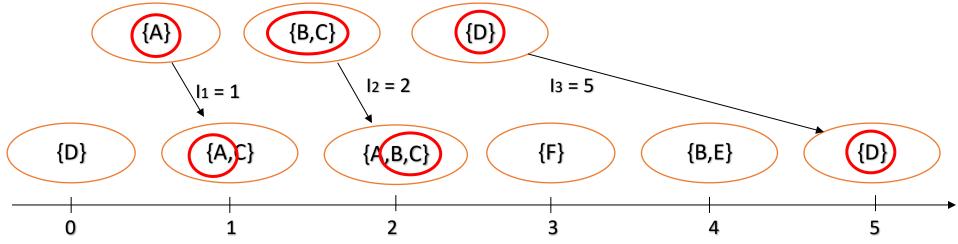

Sequence of books checked out at a library:

<{Fellowship of the Ring} {The Two Towers} {Return of the King}>

Singleton elements

Formal Definition of a Subsequence

• A sequence $\langle a_1 a_2 ... a_n \rangle$ is contained in another sequence $\langle b_1 b_2 ... b_m \rangle$ ($m \geq n$) if there exist integers $i_1 < i_2 < ... < i_n$ such that $a_1 \subseteq b_{i1}$, $a_2 \subseteq b_{i1}$, ..., $a_n \subseteq b_{in}$

Data sequence	Subsequence	Contain?
< {2,4} {3,5,6} {8} >	< {2} {3,5} >	
< {1,2} {3,4} >	< {1} {2} >	
< {2,4} {2,4} {2,5} >	< {2} {4} >	

Formal Definition of Sequential Pattern

• The **support** of a subsequence w is the fraction of data sequences that contain w

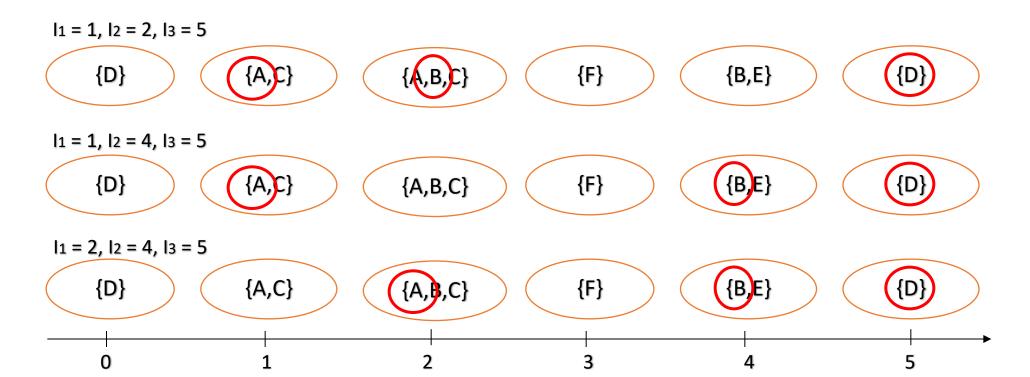

subsequence w: {B,C} {D} {A} Input sequences: {D} {D} $\{A,B,C\}$ {F} {D} {D} {A} $\{A,B,D\}$ V {D} {A,C} $\{B,C\}$ {D} {B,E} X {D} {B,C} {F} {D} 5 0

support of w: 2/4 = 0.50 (50%)

- A sequential pattern
 - is a **frequent** subsequence
 - i.e., a subsequence whose support is ≥ *minsup*

Formal Definition of Sequential Pattern

- Remark: a subsequence (i.e. a candidate pattern) might be mapped into a sequence in several different ways
 - Each mapping is an **instance** of the subsequence
 - In mining sequential patterns we need to find only one instance

{A}

{B}

{D}

Exercise 1

find instances/occurrence of the following patterns

in the input sequence below

$$\{A,C\}$$
 $\{C,D\}$ $\{F,H\}$ $\{A,B\}$ $\{B,C,D\}$ $\{E\}$ $\{A,B,D\}$ $\{F\}$ > $t=0$ $t=1$ $t=2$ $t=3$ $t=4$ $t=5$ $t=6$ $t=7$

Exercise 2

find instances/occurrence of the following patterns

in the input sequence below

$$\{A,C\}$$
 $\{C,D,E\}$ $\{F\}$ $\{A,H\}$ $\{B,C,D\}$ $\{E\}$ $\{A,B,D\}$ > $t=0$ $t=1$ $t=2$ $t=3$ $t=4$ $t=5$ $t=6$

Sequential Pattern Mining: Definition

- Given:
 - a database of sequences
 - a user-specified minimum support threshold, minsup

- Task:
 - Find all subsequences with support ≥ minsup

Sequential Pattern Mining: Challenge

- Trivial approach: generate all possible k-subsequences, for k=1,2,3,...
 and compute support
- Combinatorial explosion!
 - With frequent itemsets mining we had:
 - N. of k-subsets = $\binom{n}{k}$ n = n. of distinct items in the data
 - With sequential patterns:
 - N. of k-subsequences = n^k
 - The same item can be repeated:
 - < {A} {A} {B} {A} ... >

Sequential Pattern Mining: Challenge

- Even if we generate them from input sequences
 - E.g.: Given a n-sequence: <{a b} {c d e} {f} {g h i}>
 - Examples of subsequences:

$$\{a\} \{c d\} \{f\} \{g\} >, \{c d e\} >, \{b\} \{g\} >, etc.$$

Number of k-subsequences can be extracted from it

Answer:

$$\binom{n}{k} = \binom{9}{4} = 126$$

Sequential Pattern Mining: Example

Object	Timestamp	Events
Α	1	1,2,4
Α	2	2,3
Α	3	5
В	1	1,2
В	2	2,3,4
С	1	1, 2
С	2	2,3,4
С	3	2,4,5
D	1	2
D	2	3, 4
D	3	4, 5
E	1	1, 3
Е	2	2, 4, 5

Minsup = 50%

Examples of Frequent Subsequences:

```
< \{1,2\} > s=60\%

< \{2,3\} > s=60\%

< \{2,4\} > s=80\%

< \{3\} \{5\} > s=80\%

< \{1\} \{2\} > s=80\%

< \{2\} \{2\} > s=60\%

< \{1\} \{2,3\} > s=60\%

< \{2\} \{2,3\} > s=60\%

< \{1,2\} \{2,3\} > s=60\%
```

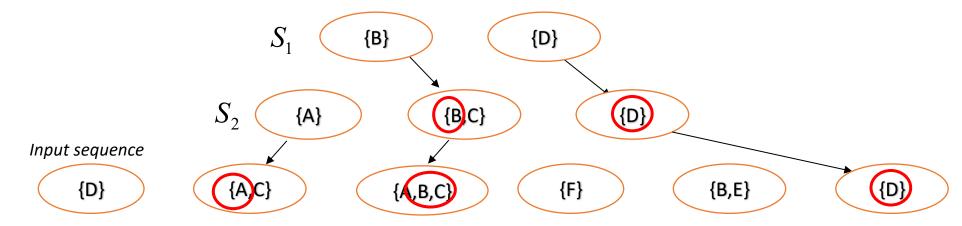

Generalized Sequential Pattern

Generalized Sequential Pattern (GSP)

- Follows the same structure of Apriori
 - Start from short patterns and find longer ones at each iteration
- Based on "Apriori principle" or "anti-monotonicity of support"
 - If one sequence S1 is contained in sequence S2, then the support of S2 cannot be larger than that of S1:

$$S_1 \subseteq S_2 \Rightarrow \sup(S_1) \ge \sup(S_2)$$

- Intuitive proof
 - Any input sequence that contains S2 will also contain S1

Generalized Sequential Pattern (GSP)

Follows the same structure of Apriori

Start from short patterns and find longer ones at each iteration

Step 1:

- Make the first pass over the sequence database D to yield all the 1-transaction frequent sequences
- Step 2: Repeat until no new frequent sequences are found:
 - Candidate Generation:
 - Merge pairs of frequent subsequences found in the (k-1)th pass to generate candidate sequences that contain k items
 - Candidate Pruning:
 - Prune candidate k-sequences that contain infrequent (k-1)-subsequences
 - Support Counting:
 - Make a new pass over the sequence database D to find the support for these candidate sequences
 - Candidate Elimination:
 - Eliminate candidate k-sequences whose actual support is less than minsup

Extracting Sequential Patterns

- Given *n* items: i₁, i₂, i₃, ..., i_n
 - Candidate 1-subsequences:

$$\langle \{i_1\} \rangle, \langle \{i_2\} \rangle, \langle \{i_3\} \rangle, ..., \langle \{i_n\} \rangle$$

Candidate 2-subsequences:

Candidate 3-subsequences:

Remark: items within a transaction are ordered

•YES:
$$\langle i_1, i_2, i_3 \rangle$$
 NO: $\langle i_3, i_1, i_2 \rangle$

Candidate Generation

- Base case (k=2):
 - Merging two frequent 1-sequences $<\{i_1\}>$ and $<\{i_2\}>$ will produce two candidate 2-sequences: $<\{i_1\}$ $\{i_2\}>$ and $<\{i_1$ $i_2\}>$
 - Special case: i₁ can be merged with itself: <{i₁} {i₁}>
- General case (k>2):
 - A frequent (k-1)-sequence w_1 is merged with another frequent (k-1)-sequence w_2 to produce a candidate k-sequence if the subsequence obtained by removing the **first event in w_1** is the same as the one obtained by removing the **last event in w_2**
 - The resulting candidate after merging is given by the sequence w_1 extended with the last event of w_2 .
 - Simplest case: $<\{d\}\{a\}\{b\}> + <\{a\}\{b\}\{c\}> = <\{d\}\{a\}\{b\}\{c\}>$
 - If last two events in w_2 belong to the same element => last event in w_2 becomes part of the last element in w_1 : <{d}{a}{b}> + <{a}{b,c}> = <{d}{a}{b,c}>
 - Otherwise, the last event in w_2 becomes a separate element appended to the end of w_1 : $<\{a,d\}\{b\}>+<\{d\}\{b\}\{c\}>=<\{a,d\}\{b\}\{c\}>$
 - Special case: check if w₁ can be merged with itself
 - Works when it contains only one event type: < {a} {a}> + <{a} {a}> = < {a} {a}>

Candidate Generation Examples

- Merging the sequences $w_1 = <\{1\} \{2\ 3\} \{4\} > \text{ and } w_2 = <\{2\ 3\} \{4\ 5\} >$
- will produce the candidate sequence $< \{1\} \{2\ 3\} \{4\ 5\}$ because the last two events in w_2 (4 and 5) belong to the same element
- Merging the sequences $w_1 = <\{1\} \{2\ 3\} \{4\} > \text{ and } w_2 = <\{2\ 3\} \{4\} \{5\} >$
- will produce the candidate sequence < $\{1\}$ $\{2\ 3\}$ $\{4\}$ $\{5\}$ > because the last two events in w_2 (4 and 5) do not belong to the same element
- Can we merge $w_1 = <\{1\} \{2 \ 6\} \{4\} > \text{ and } w_2 = <\{1\} \{2\} \{4 \ 5\} > ?$
- We **do not have** to merge the sequences $w_1 = <\{1\} \{2 \ 6\} \{4\} >$ and $w_2 = <\{1\} \{2 \ 6\} \{4 \ 5\} >$ to produce the candidate $<\{1\} \{2 \ 6\} \{4 \ 5\} >$
- Notice that if the latter is a viable candidate, it will be obtained by merging w1 with < {2 6} {4 5}>

Candidate Pruning

Based on Apriori principle:

• If a k-sequence W contains a (k-1)-subsequence that is not frequent, then W is not frequent and can be pruned

Method:

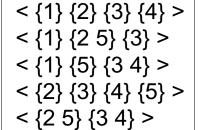

- Enumerate all (k-1)-subsequence:
 - {a,b}{c}{d} → {b}{c}{d}, {a}{c}{d}, {a,b}{d}, {a,b}{c}
- Each subsequence generated by cancelling 1 event in W
 - Number of (k-1)-subsequences = k
- Remark: candidates are generated by merging two "mother" (k-1)-subsequences that we
 know to be frequent
 - Correspond to remove the first event or the last one
 - Number of significant (k-1)-subsequences to test = k − 2
 - Special cases: at step k=2 the pruning has no utility, since the only (k-1)-subsequences are the "mother" ones

GSP Example

Frequent 3-sequences

< {1} {2} {3} >
< {1} {2 5} >
< {1} {2 5} >
< {1} {5} {3} >
< {2} {3} {4} >
< {2 5} {3} >
< {2 5} {3} >
< {3} {4} >
< {3} {4} {5} >
< {5} {3 4} >

Candidate Generation

Candidate Pruning

< {1} {2 5} {3} >

GSP Exercise

Given the following dataset of sequences

ID	Sequence				
1	a b	\rightarrow	a	\rightarrow	b
2	b	\rightarrow	a	\rightarrow	c d
3	а	\rightarrow	b		
4	а	\rightarrow	а	\rightarrow	b d

Generate sequential patterns if min_sup = 35%

GSP Exercise - Solution

ID	Sequence				
1	a b	\rightarrow	а	\rightarrow	b
2	b	\rightarrow	а	\rightarrow	c d
3	а	\rightarrow	b		
4	а	\rightarrow	а	\rightarrow	b d

	S	eque	ntial pa	attern	Support
а					100 %
b					100 %
d					50 %
а	\rightarrow	а			50 %
а	\rightarrow	b			75 %
а	\rightarrow	d			50 %
b	\rightarrow	а			50 %
а	\rightarrow	а	\rightarrow	b	50 %

Timing Constraints

- Motivation by examples:
- Sequential Pattern {milk} → {cookies}
 - It might suggest that cookies are bought to better enjoy milk
 - Yet, we might obtain it even if all customers by milk and after 6 months buy cookies, in which case our interpretation is wrong
- {cheese A} → {cheese B}
 - Does it mean that buying and eating cheese A induces the customer to try also cheese B (e.g. by the same brand)?
 - Maybe, yet if they are bought within 20 minutes it is like that they were to be bought together (and the customer forgot it)
- {buy PC} \rightarrow {buy printer} \rightarrow {ask for repair}
 - Is it a good or bad sign?
 - It depends on how much time the whole process took:
 - Short time => issues, Long time => OK, normal life cycle

Timing Constraints

- Define 3 types of constraint on the instances to consider
 - E.g. ask that the pattern instances last no more than 30 days

x_g: max-gap

→ Each element of the pattern instance must be at most x_g time after the previous one

n_g: min-gap

→ Each element of the pattern instance must be at least n_g time after the previous one

 m_s : maximum span \rightarrow instance mus

The overall duration of the pattern instance must be at most **m**_s

$$x_g = 2$$
, $n_g = 0$, $m_s = 4$

consecutive elements at most distance 2 & overall duration at most 4 time units

Data sequence	Subsequence	Contain?
< {2,4} {3,5,6} {4,7} {4,5} {8} >	< {6} {5} >	
< {1} {2} {3} {4} {5}>	< {1} {4} >	
< {1} {2,3} {3,4} {4,5}>	< {2} {3} {5} >	
< {1,2} {3} {2,3} {3,4} {2,4} {4,5}>	< {1,2} {5} >	

Mining Sequential Patterns with Timing Constraints

Approach 1:

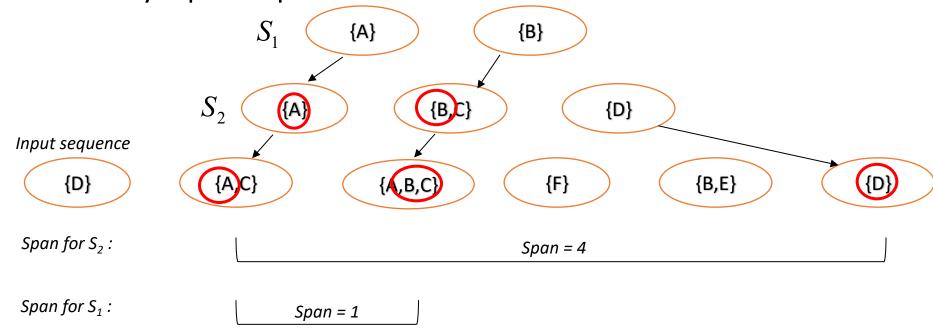

- Mine sequential patterns without timing constraints
- Postprocess the discovered patterns
- Dangerous: might generate billions of sequential patterns to obtain only a few time-constrained ones

Approach 2:

- Modify GSP to directly prune candidates that violate timing constraints
- Question:
 - Does Apriori principle still hold?

Apriori Principle with Time Constraints

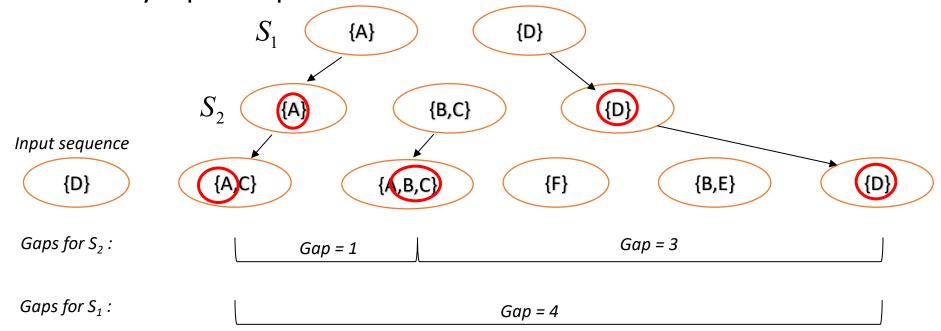

- Case 1: max-span
- Intuitive check
 - Does any input sequence that contains S2 will also contain S1?

- When S1 has less elements, S1 span can (only) decrease
 - If S2 span is OK, then also S1 span is OK

Apriori Principle with Time Constraints

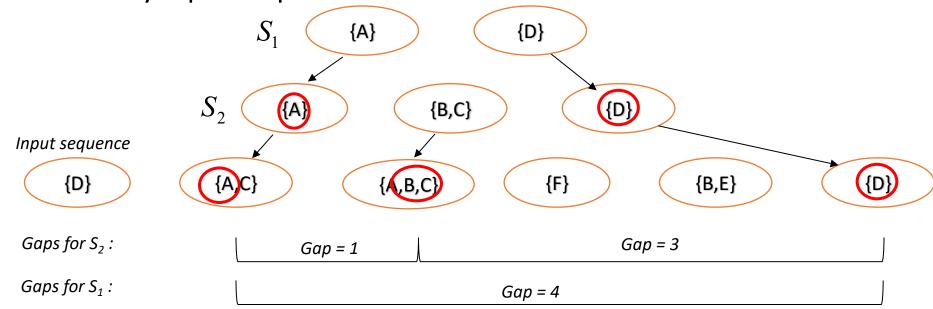

- Case 2: min-gap
- Intuitive check
 - Does any input sequence that contains S2 will also contain S1?

- When S1 has less elements, gaps for S1 can (only) increase
 - If S2 gaps are OK, they are OK also for S1

Apriori Principle with Time Constraints

- Case 3: max-gap
- Intuitive check
 - Does any input sequence that contains S2 will also contain S1?

- When S1 has less elements, gaps for S1 can (only) increase
 - Happens when S1 has lost an internal element w.r.t. S2
 - Even if S2 gaps are OK, S1 gaps might grow too large w.r.t. max-gap

Apriori Principle for Sequence Data

Object	Timestamp	Events
Α	1	1,2,4
Α	2	2,3
Α	3	5
В	1	1,2
В	2	2,3,4
С	1	1, 2
С	2	2,3,4 2,4,5
С	3	2,4,5
D	1	2
D	2	3, 4
D	3	4, 5
E	1	1, 3
E	2	2, 4, 5

Suppose:

$$x_g = 1 \text{ (max-gap)}$$
 $n_g = 0 \text{ (min-gap)}$
 $m_s = 5 \text{ (maximum span)}$
 $minsup = 60\%$

<{2} {5}> support = 40%

but

<{2} {3} {5}> support = 60%

Problem exists because of max-gap constraint

No such problem if max-gap is infinite

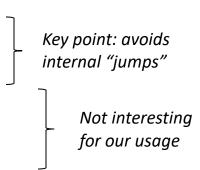

Contiguous Subsequences

s is a contiguous subsequence of

$$w = \langle e_1 \rangle \langle e_2 \rangle ... \langle e_k \rangle$$

if any of the following conditions hold:

- 1. s is obtained from w by deleting an item from either e_1 or e_k
- 2. s is obtained from w by deleting an item from any element e_i that contains more than 2 items
- s is a contiguous subsequence of s' and s' is a contiguous subsequence of w (recursive definition)
- Examples: $s = < \{1\} \{2\} >$
 - is a contiguous subsequence of{1} {2 3}>, < {1 2} {2} {3}>, and < {3 4} {1 2} {2 3} {4} >
 - is not a contiguous subsequence of{1} {3} {2}> and < {2} {1} {3} {2}>

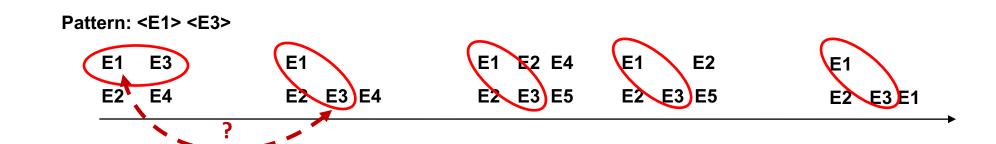

Modified Candidate Pruning Step

- Without maxgap constraint:
 - A candidate k-sequence is pruned if at least one of its (k-1)-subsequences is infrequent
- With maxgap constraint:
 - A candidate k-sequence is pruned if at least one of its **contiguous** (k-1)-subsequences is infrequent
 - Remark: the "pruning power" is now reduced
 - Less subsequences to test for "killing" the candidate

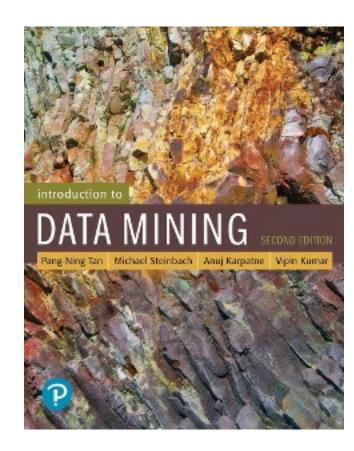

Other kinds of patterns for sequences

- In some domains, we may have only one very long time series
 - Example:
 - monitoring network traffic events for attacks
 - monitoring telecommunication alarm signals
- Goal is to find frequent sequences of events in the time series
 - Now we have to count "instances", but which ones?
 - This problem is also known as frequent episode mining

Exercises SPM

a) (3 points) Given the following input sequence

show all the occurrences (there can be more than one or none, in general) of each of the following subsequences in the input sequence above. Repeat the exercise twice: the first time considering no temporal constraints (left column): the second time considering min-gap = 1 (i.e. gap > 1, right column). Each occurrence should be represented by its corresponding list of time stamps, e.g..: <0,2,3>=<t=0, t=2, t=3>.

	Occurrences	Occurrences with min-gap =1
ex.: <{B}{E}>	<1,2> <1,6> <3,6>	<1,6><3,6>
$w_1 = \{A\} \{B\} \{E\} >$		
$w_2 = \{B\}\{D\} >$		
$w_3 = \{F\}\{E\}\{C,D\}>$		

a) (3 points) Given the following input sequence

show all the occurrences (there can be more than one or none, in general) of each of the following subsequences in the input sequence above. Repeat the exercise twice: the first time considering no temporal constraints (left column): the second time considering min-gap = 1 (i.e. gap > 1, right column). Each occurrence should be represented by its corresponding list of time stamps, e.g..: <0,2,3>=<t=0, t=2, t=3>.

Answer:				
	Occurrences	Occurrences with min-gap =1		
$ex.: <{B}{E}>$	<1,2> <1,6> <3,6>	<1,6><3,6>		
$w_1 = \{A\} \{B\} \{E\} >$				
$w_2 = \langle \{B\} \{D\} \rangle$				
$w_3 = \langle \{F\} \{E\} \{C,D\} \rangle$				

Sequential Pattern – Exercise 1 – Solution

a) (3 points) Given the following input sequence

show all the occurrences (there can be more than one or none, in general) of each of the following subsequences in the input sequence above. Repeat the exercise twice: the first time considering no temporal constraints (left column): the second time considering min-gap = 1 (i.e. gap > 1, right column). Each occurrence should be represented by its corresponding list of time stamps, e.g..: <0,2,3>=<t=0, t=2, t=3>.

Answer:		
	Occurrences	Occurrences with min-gap =1
ex.: <{B}{E}>	<1,2> <1,6> <3,6>	<1,6><3,6>
$w_1 = \{A\} \{B\} \{E\} >$	<0,1,2> <0,1,6> <0,3,6>	<0,3,6>
$w_2 = \langle \{B\}\{D\} \rangle$	<1,4> <1,7> <3,4> <3,7> <6,7>	<1,4> <1,7> <3,7>
$w_3 = \langle \{F\} \{E\} \{C,D\} \rangle$	<1,2,4> <1,2,7> <1,6,7> <5,6,7>	none

a) (3 points) Given the following input sequence

$$\{B,F\}$$
 $\{A\}$ $\{A,B\}$ $\{C,D,F\}$ $\{E\}$ $\{B,E\}$ $\{C,D\}$ > $t=0$ $t=1$ $t=2$ $t=3$ $t=4$ $t=5$ $t=6$

show all the occurrences (there can be more than one or none, in general) of each of the following subsequences in the input sequence above. Repeat the exercise twice: the first time considering no temporal constraints (left column): the second time considering max-gap = 4 (i.e. gap \le 4, right column). Each occurrence should be represented by its corresponding list of time stamps, e.g.: <0,2,3> = <t=0, t=2, t=3>.

	Occurrences	Occurrences with max-gap =4
$w_1 = \{B\} \{E\} >$		
$w_2 = \langle \{B\}\{D\} \rangle$		
$w_3 = \langle \{F\} \{B\} \{C,D\} \rangle$		

Sequential Pattern – Exercise 2 – Solution

a) **(3 points)** Given the following input sequence

show all the occurrences (there can be more than one or none, in general) of each of the following subsequences in the input sequence above. Repeat the exercise twice: the first time considering no temporal constraints (left column): the second time considering max-gap = 4 (i.e. gap \le 4, right column). Each occurrence should be represented by its corresponding list of time stamps, e.g.: <0,2,3> = <t=0, t=2, t=3>.

Answer:

	Occurrences	Occurrences with max-gap =4
$w_1 = \langle \{B\} \{E\} \rangle$	<0,4> <0,5> <2,4> <2,5>	<0,4> <2,4> <2,5>
$w_2 = \langle \{B\} \{D\} \rangle$	<0,3><0,6>	< <mark>0,3></mark>
	<2,3> <2,6> <5,6>	<2,3> <2,6> <5,6>
= <(E) (D) (C D) >		
$w_3 = \{F\}\{B\}\{C,D\} >$	<0,2,3> <0,2,6> <0,5,6> <3,5,6>	<0,2,3> <0,2,6> <3,5,6>

Given the input sequences listed in the table below (column 1), show for each of them **all the occurrences** of subsequences $\{A\} \rightarrow \{D\}$ and $\{A\} \rightarrow \{C,D\}$, and finally write its total support. Repeat the exercise twice: the first time **considering no temporal constraints** (columns 2 and 4); the second time **considering min-gap = 1** (i.e. gap > 1) (columns 3 and 5). Each occurrence should be represented by its corresponding list of time stamps, e.g.: <0,2,3>=<t=0, t=2, t=3>.

column 1	column 2	column 3	column 4	column 5

Total support:				

Sequential Pattern – Exercise 3 – Solution

Given the input sequences listed in the table below (column 1), show for each of them **all the occurrences** of subsequences $\{A\} \rightarrow \{D\}$ and $\{A\} \rightarrow \{C,D\}$, and finally write its total support. Repeat the exercise twice: the first time **considering no temporal constraints** (columns 2 and 4); the second time **considering min-gap = 1** (i.e. gap > 1) (columns 3 and 5). Each occurrence should be represented by its corresponding list of time stamps, e.g.: <0,2,3>=< t=0, t=2, t=3>.

column 1	column 2	column 3	column 4	column 5
	$\{A\} \rightarrow \{D\}$	}	{ B } → {	{C,D}
	No constraints	min- $gap = 1$	No constraints	min- $gap = 1$
< {A,B,F} {C} {C,D,F} {E} {C,D} > t=0 t=1 t=2 t=3 t=4	<0,2>, <0,4>	<0,2><0,4>	<0,2>,<0,4>	<0,2>, <0,4>

Total support:	5 (100%)	5 (100%)	<mark>4 (80%)</mark>	3 (60%)

Given the input sequences listed in the table below (column 1), show for each of them all the occurrences of subsequences $\{A\} \rightarrow \{A\} \rightarrow \{D\}$ and $\{B\} \rightarrow \{C,D\}$, and finally write its total support. Repeat the exercise twice: the first time considering no temporal constraints (columns 2 and 4); the second time considering max-gap = 2 (i.e. gap <= 2) (columns 3 and 5). Each occurrence should be represented by its corresponding list of time stamps, e.g.: <0,2,3>=<t=0, t=2, t=3>.

column 1	column 2	column 3	column 4	column 5
	$\{A\} \to \{A\} \to \{D\}$		{ B } → {	C,D}
	No constraints	max- $gap = 2$	No constraints	max- $gap = 2$
< {A,B,F} {C} {A,C,D,F} {E} {C,D} > t=0 t=1 t=2 t=3 t=4				
< {A,B} {C} {A,B} {C,D} > t=0 t=1 t=2 t=3				
< {F} {A,F} {A,C} {D} {A,E} {C} > t=0 t=1 t=2 t=3 t=4 t=5				
< {A,F} {B,C,D} {A,B} {B,E} {D} > t=0 t=1 t=2 t=3 t=4				
<{A,B}{A}{A,D}{A}{C}{A}{C,D}> t=0 t=1 t=2 t=3 t=4 t=5 t=6	NOT REQUESTED			
Total support:				

GSP – Exercise 1

b) **(3 points)** Simulate the execution of the GSP algorithm on the following dataset of sequences, assuming a minimum support threshold of 60%.

GSP – Exercise 1 – Solution

b) **(3 points)** Simulate the execution of the GSP algorithm on the following dataset of sequences, assuming a minimum support threshold of 60%.

```
{A} -> {BC} -> {C} -> {D}

{AC} -> {B} -> {C} -> {C}

{D} -> {C} -> {B} -> {CD}

{AB} -> {D} -> {C} -> {E}
```

GSP – Exercise 1 – Solution

b) **(3 points)** Simulate the execution of the GSP algorithm on the following dataset of sequences, assuming a minimum support threshold of 60%.

{ A }	
{ B }	
{ C }	
{ D }	
{ BC }	
{ AC }	
{ CD }	
{ AB }	

GSP – Exercise 2

b) **(3 points)** Running the GSP algorithm on a dataset of sequences, at the end of the second iteration it found the frequent 3-sequences on the left, and at the next iteration it generated (among the others) the candidate 4-sequences on the right. Which of the candidates will be **pruned**, and why?

Frequent 3-sequences

Candidates

GSP – Exercise 2 – Solution

b) **(3 points)** Running the GSP algorithm on a dataset of sequences, at the end of the second iteration it found the frequent 3-sequences on the left, and at the next iteration it generated (among the others) the candidate 4-sequences on the right. Which of the candidates will be **pruned**, and why?

Frequent 3-sequences

Candidates

{AB} → {CD}
 {A} → {D} → {C} → {D}
 {B} → {D} → {C} → {D}
 {AB} → {D} → {C} → {D}
 {AB} → {D} → {C}
 {AB} → {C} → {D}

Answer:

Candidates

```
1. {AB} → {CD}

2. {A} → {D} → {C} → {D} ← PRUNED

3. {B} → {D} → {C} → {D} ← PRUNED

4. {AB} → {D} → {C}

5. {AB} → {C} → {D}
```

Missing from frequent 3-sequences

- A -> D -> D
- B -> D -> D
