

# **Data Mining Cluster Analysis: Basic Concepts and Algorithms**

---

Lecture Notes for Chapter 7

Introduction to Data Mining, 2<sup>nd</sup> Edition

by

Tan, Steinbach, Karpatne, Kumar

# Hierarchical Clustering

- Produces a set of **nested clusters** organized as a hierarchical tree
- Can be visualized as a dendrogram
  - A tree like diagram that records the sequences of merges or splits

# Strengths of Hierarchical Clustering

---

- Do not have to assume any particular number of clusters
  - Any desired number of clusters can be obtained by **'cutting' the dendrogram** at the proper level
- They may correspond to meaningful taxonomies
  - Example in biological sciences (e.g., animal kingdom, phylogeny reconstruction, ...)

# Hierarchical Clustering

---

- Two main types of hierarchical clustering
  - Agglomerative:
    - ◆ Start with the points as individual clusters
    - ◆ At each step, **merge the closest pair** of clusters until only one cluster (or k clusters) left
  - Divisive:
    - ◆ Start with one, all-inclusive cluster
    - ◆ At each step, **split a cluster** until each cluster contains an individual point (or there are k clusters)
- Traditional hierarchical algorithms use a similarity or distance matrix
  - Merge or split one cluster at a time

# Agglomerative Clustering Algorithm

---

- Most popular hierarchical clustering technique
- Basic algorithm is straightforward
  1. Compute the proximity matrix
  2. Let each data point be a cluster
  3. **Repeat**
  4. Merge the two closest clusters
  5. Update the proximity matrix
  6. **Until** only a single cluster remains
- Key operation is the computation of the proximity of two clusters
  - Different approaches to defining the distance between clusters distinguish the different algorithms

# Starting Situation

- Start with clusters of individual points and a proximity matrix

	p1	p2	p3	p4	p5	...
p1						
p2						
p3						
p4						
p5						
.						
.						
.						

**Proximity Matrix**

# Intermediate Situation

- After some merging steps, we have some clusters

	C1	C2	C3	C4	C5
C1					
C2					
C3					
C4					
C5					

Proximity Matrix

# Intermediate Situation

- We want to merge the two closest clusters (C2 and C5) and update the proximity matrix.

	C1	C2	C3	C4	C5
C1					
C2					
C3					
C4					
C5					

Proximity Matrix

# After Merging

- The question is “How do we update the proximity matrix?”

	C1	C2 U C5	C3	C4
C1		?		
C2 U C5	?	?	?	?
C3		?		
C4		?		

Proximity Matrix

# How to Define Inter-Cluster Distance

- MIN
- MAX
- Group Average
- Distance Between Centroids
- Other methods driven by an objective function
  - Ward's Method uses squared error

	p1	p2	p3	p4	p5	...
p1						
p2						
p3						
p4						
p5						
.						
.						
.

**Proximity Matrix**

# MIN or Single Link

- Proximity of two clusters is based on the two closest points in the different clusters
  - Determined by one pair of points, i.e., by one link in the proximity graph
- Example:

Distance Matrix:

	p1	p2	p3	p4	p5	p6
p1	0.00	0.24	0.22	0.37	0.34	0.23
p2	0.24	0.00	0.15	0.20	0.14	0.25
p3	0.22	0.15	0.00	0.15	0.28	0.11
p4	0.37	0.20	0.15	0.00	0.29	0.22
p5	0.34	0.14	0.28	0.29	0.00	0.39
p6	0.23	0.25	0.11	0.22	0.39	0.00

# Hierarchical Clustering: MIN

Nested Clusters

Dendrogram

# Strength of MIN

---

Original Points

Six Clusters

- Can handle non-elliptical shapes

# Limitations of MIN

Original Points

- Sensitive to noise and outliers

Two Clusters

Three Clusters

# MAX or Complete Linkage

- Proximity of two clusters is based on the two most distant points in the different clusters
  - Determined by all pairs of points in the two clusters

**Distance Matrix:**

	p1	p2	p3	p4	p5	p6
p1	0.00	0.24	0.22	0.37	0.34	0.23
p2	0.24	0.00	0.15	0.20	0.14	0.25
p3	0.22	0.15	0.00	0.15	0.28	0.11
p4	0.37	0.20	0.15	0.00	0.29	0.22
p5	0.34	0.14	0.28	0.29	0.00	0.39
p6	0.23	0.25	0.11	0.22	0.39	0.00

# Hierarchical Clustering: MAX

**Nested Clusters**

**Dendrogram**

# Strength of MAX

---

- Less susceptible to noise and outliers

# Limitations of MAX

---

---

Original Points

Two Clusters

- Tends to break large clusters
- Biased towards globular clusters

# Group Average

- Proximity of two clusters is the average of pairwise proximity between points in the two clusters.

$$\text{proximity}(\text{Cluster } i, \text{Cluster } j) = \frac{\sum_{\substack{p_i \in \text{Cluster } i \\ p_j \in \text{Cluster } j}} \text{proximity}(p_i, p_j)}{|\text{Cluster } i| \times |\text{Cluster } j|}$$

- Need to use average connectivity for scalability since total proximity favors large clusters

Distance Matrix:

	p1	p2	p3	p4	p5	p6
p1	0.00	0.24	0.22	0.37	0.34	0.23
p2	0.24	0.00	0.15	0.20	0.14	0.25
p3	0.22	0.15	0.00	0.15	0.28	0.11
p4	0.37	0.20	0.15	0.00	0.29	0.22
p5	0.34	0.14	0.28	0.29	0.00	0.39
p6	0.23	0.25	0.11	0.22	0.39	0.00

# Hierarchical Clustering: Group Average

**Nested Clusters**

**Dendrogram**

# Hierarchical Clustering: Group Average

---

- Compromise between Single and Complete Link
- Strengths
  - Less susceptible to noise and outliers
- Limitations
  - Biased towards globular clusters

# Cluster Similarity: Ward's Method

---

- Similarity of two clusters is based on the increase in squared error when two clusters are merged
  - Similar to group average if distance between points is distance squared
- Less susceptible to noise and outliers
- Biased towards globular clusters
- Hierarchical analogue of K-means
  - Can be used to initialize K-means

# Hierarchical Clustering: Comparison

MIN

MAX

Group Average

Ward's Method

# MST: Divisive Hierarchical Clustering

- Build MST (Minimum Spanning Tree)
  - Start with a tree that consists of any point
  - In successive steps, look for the closest pair of points  $(p, q)$  such that one point  $(p)$  is in the current tree but the other  $(q)$  is not
  - Add  $q$  to the tree and put an edge between  $p$  and  $q$

# MST: Divisive Hierarchical Clustering

---

---

- Use MST for constructing hierarchy of clusters

---

## Algorithm 7.5 MST Divisive Hierarchical Clustering Algorithm

---

- 1: Compute a minimum spanning tree for the proximity graph.
  - 2: **repeat**
  - 3:   Create a new cluster by breaking the link corresponding to the largest distance (smallest similarity).
  - 4: **until** Only singleton clusters remain
-

# Hierarchical Clustering: Time and Space requirements

---

- $O(N^2)$  space since it uses the proximity matrix.
  - $N$  is the number of points.
  
- $O(N^3)$  time in many cases
  - There are  $N$  steps and at each step the size,  $N^2$ , proximity matrix must be updated and searched
  - Complexity can be reduced to  $O(N^2 \log(N))$  time with some cleverness

# Hierarchical Clustering: Problems and Limitations

---

- Once a decision is made to combine two clusters, it cannot be undone
- No global objective function is directly minimized
- Different schemes have problems with one or more of the following:
  - Sensitivity to noise and outliers
  - Difficulty handling clusters of different sizes and non-globular shapes
  - Breaking large clusters
