

AN ALTERNATIVE METHOD FOR ASSOCIATION RULES

The Apriori algorithm

Level-wise approach

C_k = candidate itemsets of size k
 L_k = frequent itemsets of size k

1. $k = 1, C_1$ = all items
2. While C_k not empty

Frequent itemset generation

3. Scan the database to find which itemsets in C_k are frequent and put them into L_k

Candidate generation

4. Use L_k to generate a collection of candidate itemsets C_{k+1} of size $k+1$

5. $k = k+1$

Factors affecting the complexity

- **Choice of minimum support threshold**
 - lowering min support results in more frequent itemsets this may increase number of candidates and max length of frequent itemsets
- **Dimensionality (number of items of the dataset)**
 - more space is needed to store support count of each item
 - if number of frequent items also increases, both computation and I/O costs may also increase
- **Size of database**
 - since Apriori makes multiple passes, run time of algorithm may increase with number of transactions
- **Average transaction length**
 - transaction length increases with denser data sets
 - this may increase max length of frequent itemsets and traversals of hash tree (number of subsets in a transaction increases with its length)

THE FP-TREE AND THE FP-GROWTH ALGORITHM

Overview

- The FP-tree contains a compressed representation of the transaction database.
 - A trie (prefix-tree) data structure is used
 - Each transaction is a path in the tree – paths can overlap.
- Once the FP-tree is constructed the recursive, divide-and-conquer FP-Growth algorithm is used to enumerate all frequent itemsets.

FP-tree Construction

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

- The FP-tree is a **trie (prefix tree)**
- Since transactions are sets of items, we need to transform them into **ordered sequences** so that we can have prefixes
 - Otherwise, there is no common prefix between sets {A,B} and {B,C,A}
- We need to impose an **order** to the items
 - Initially, assume a **lexicographic order**.

FP-tree Construction

- Initially the tree is empty

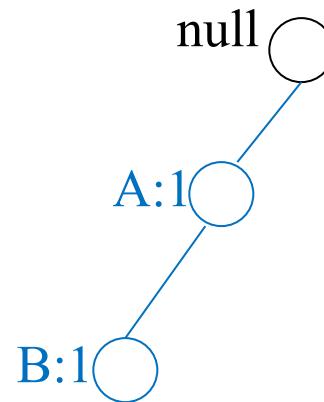

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

FP-tree Construction

- Reading transaction TID = 1

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

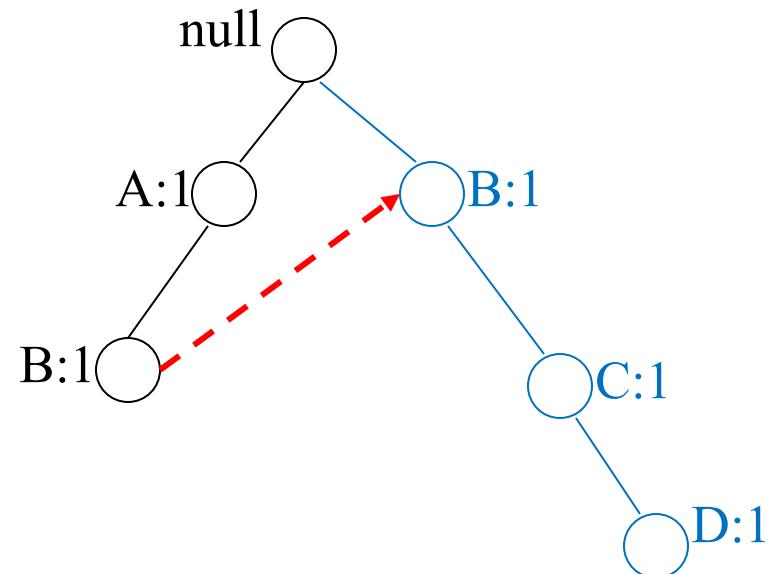

Node label = item:support

- Each node in the tree has a **label** consisting of the item and the support (number of transactions that reach that node, i.e. follow that **path**)

FP-tree Construction

- Reading transaction TID = 2

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

Each transaction is a path in the tree

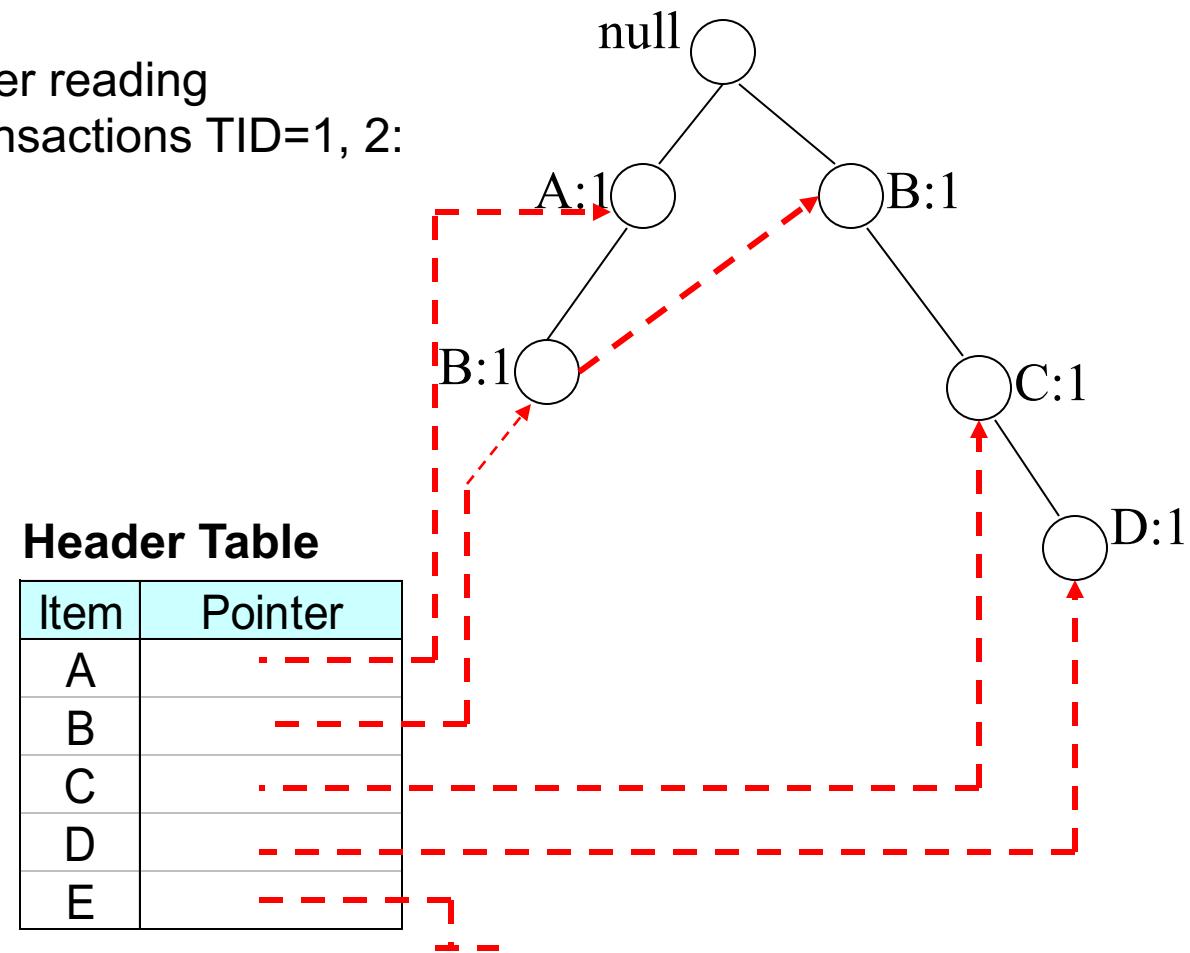

- We add **pointers** between nodes that refer to the same item

FP-tree Construction

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

The **Header Table** and the pointers assist in computing the itemset support

After reading transactions TID=1, 2:

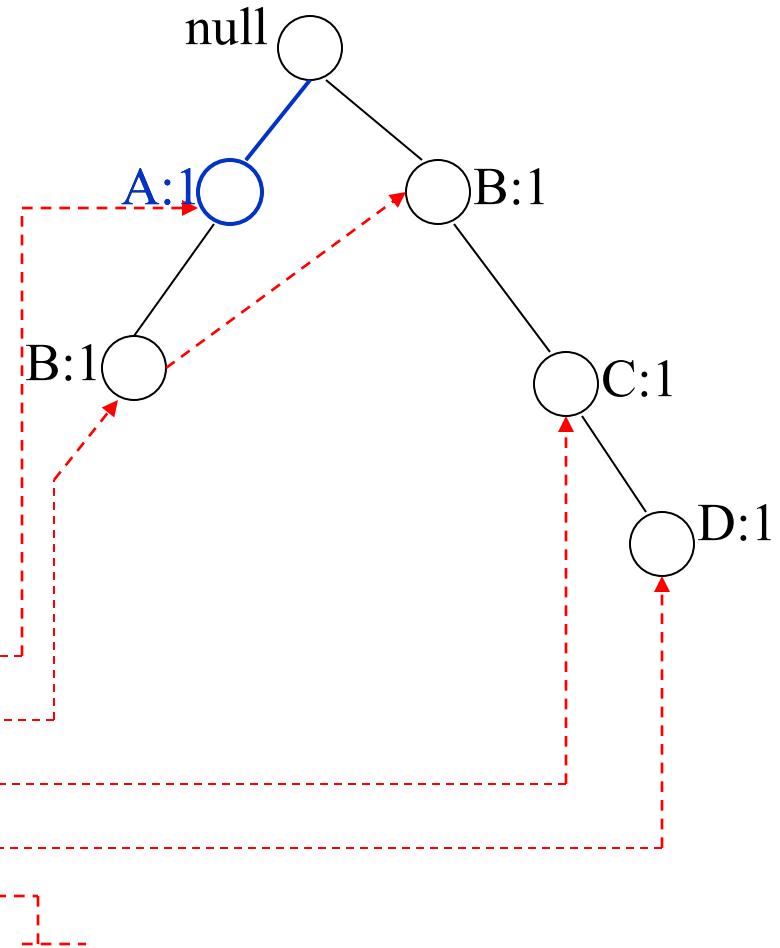

FP-tree Construction

- Reading transaction TID = 3

| TID | Items |
|-----|------------------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

| Item | Pointer |
|------|---------|
| A | ----- |
| B | ----- |
| C | ----- |
| D | ----- |
| E | ----- |

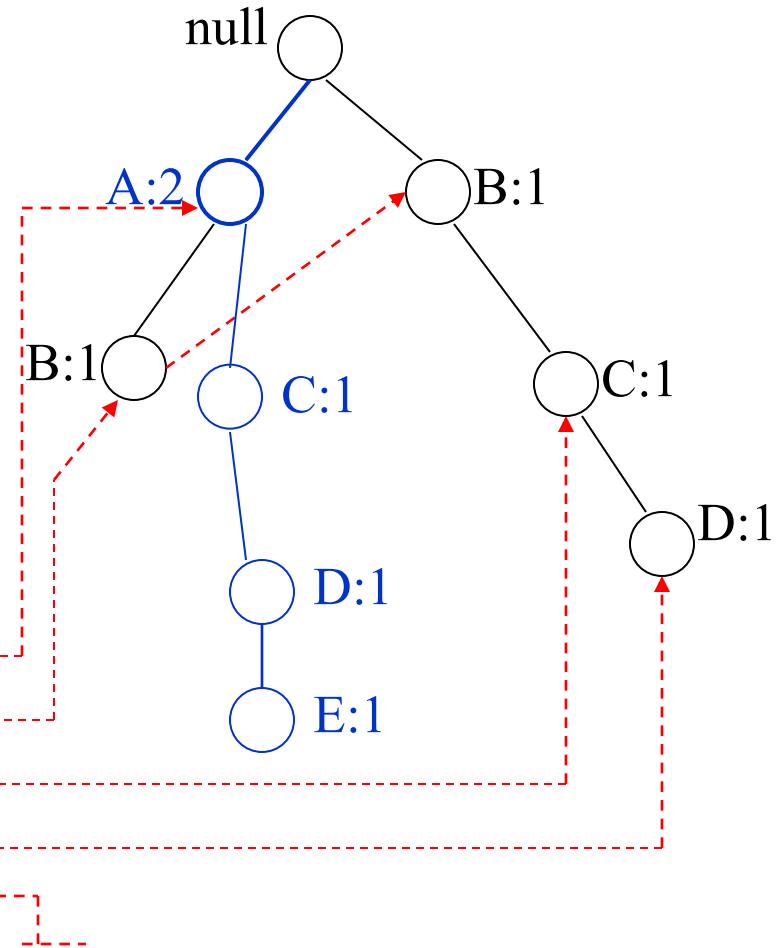

FP-tree Construction

- Reading transaction TID = 3

| TID | Items |
|-----|------------------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

| Item | Pointer |
|------|---------|
| A | ----- |
| B | ----- |
| C | ----- |
| D | ----- |
| E | ----- |

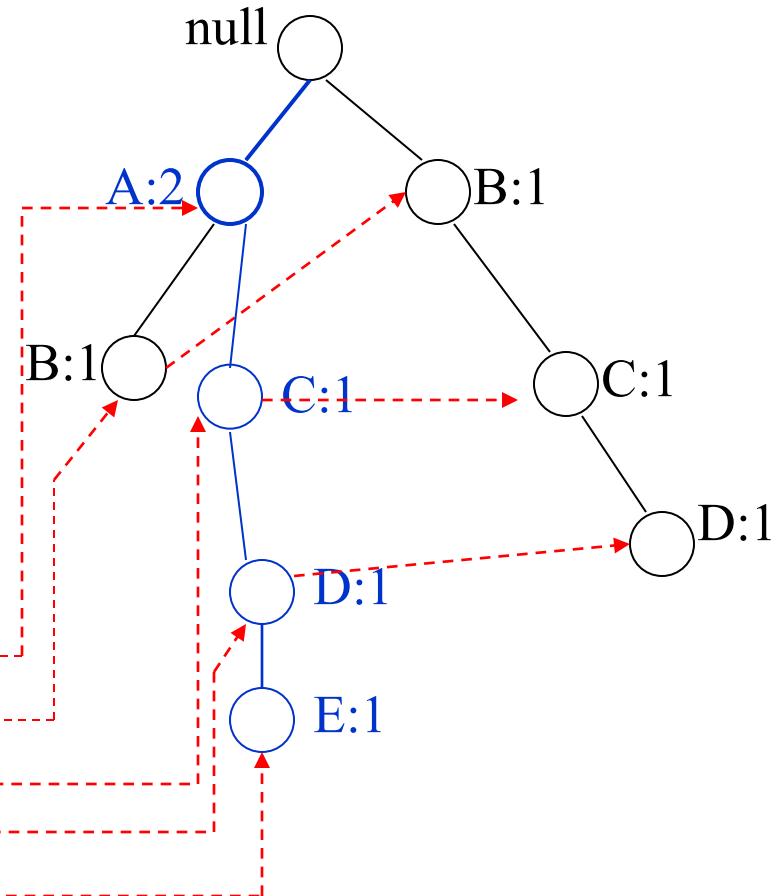

FP-tree Construction

- Reading transaction TID = 3

| TID | Items |
|-----|------------------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

| Item | Pointer |
|------|---------|
| A | - |
| B | - |
| C | - |
| D | - |
| E | - |

Each transaction is a path in the tree

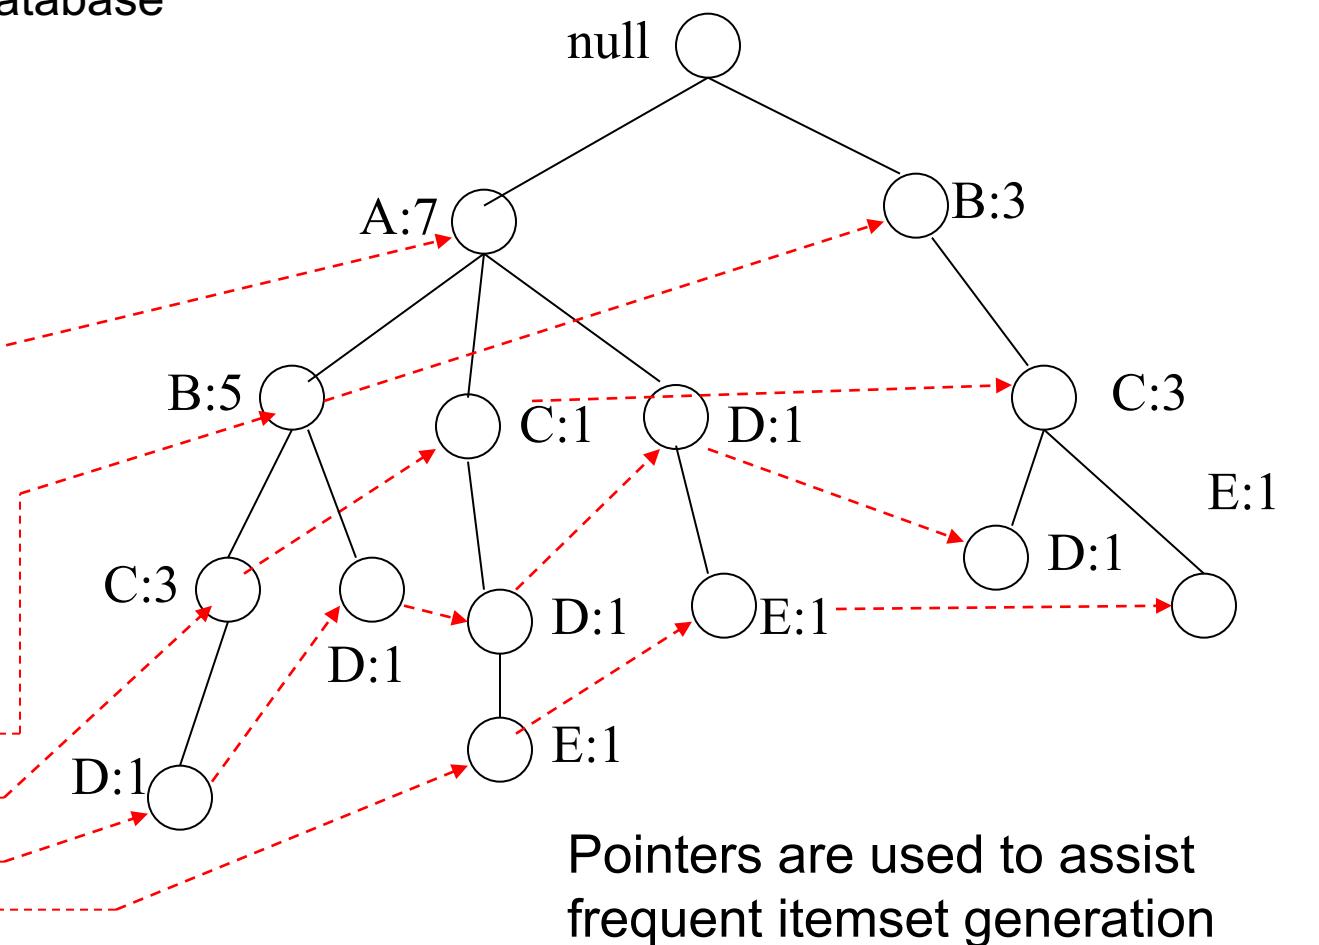

FP-Tree Construction

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

Transaction Database

Header table

| Item | Pointer |
|------|---------|
| A | |
| B | |
| C | |
| D | |
| E | |

FP-tree size

- Every transaction is a path in the FP-tree
- **The size of the tree depends on the compressibility of the data**
 - **Extreme case:** All transactions are the same, the FP-tree is a single branch
 - **Extreme case:** All transactions are different the size of the tree is the same as that of the database (bigger actually since we need additional pointers)

Item ordering

- The size of the tree also depends on the ordering of the items.
- **Heuristic:** order the items in according to their frequency from larger to smaller.
 - We would need to do an extra pass over the dataset to count frequencies
- Example:

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

$\sigma(A)=7$, $\sigma(B)=8$,
 $\sigma(C)=7$, $\sigma(D)=5$,
 $\sigma(E)=3$
Ordering : B,A,C,D,E

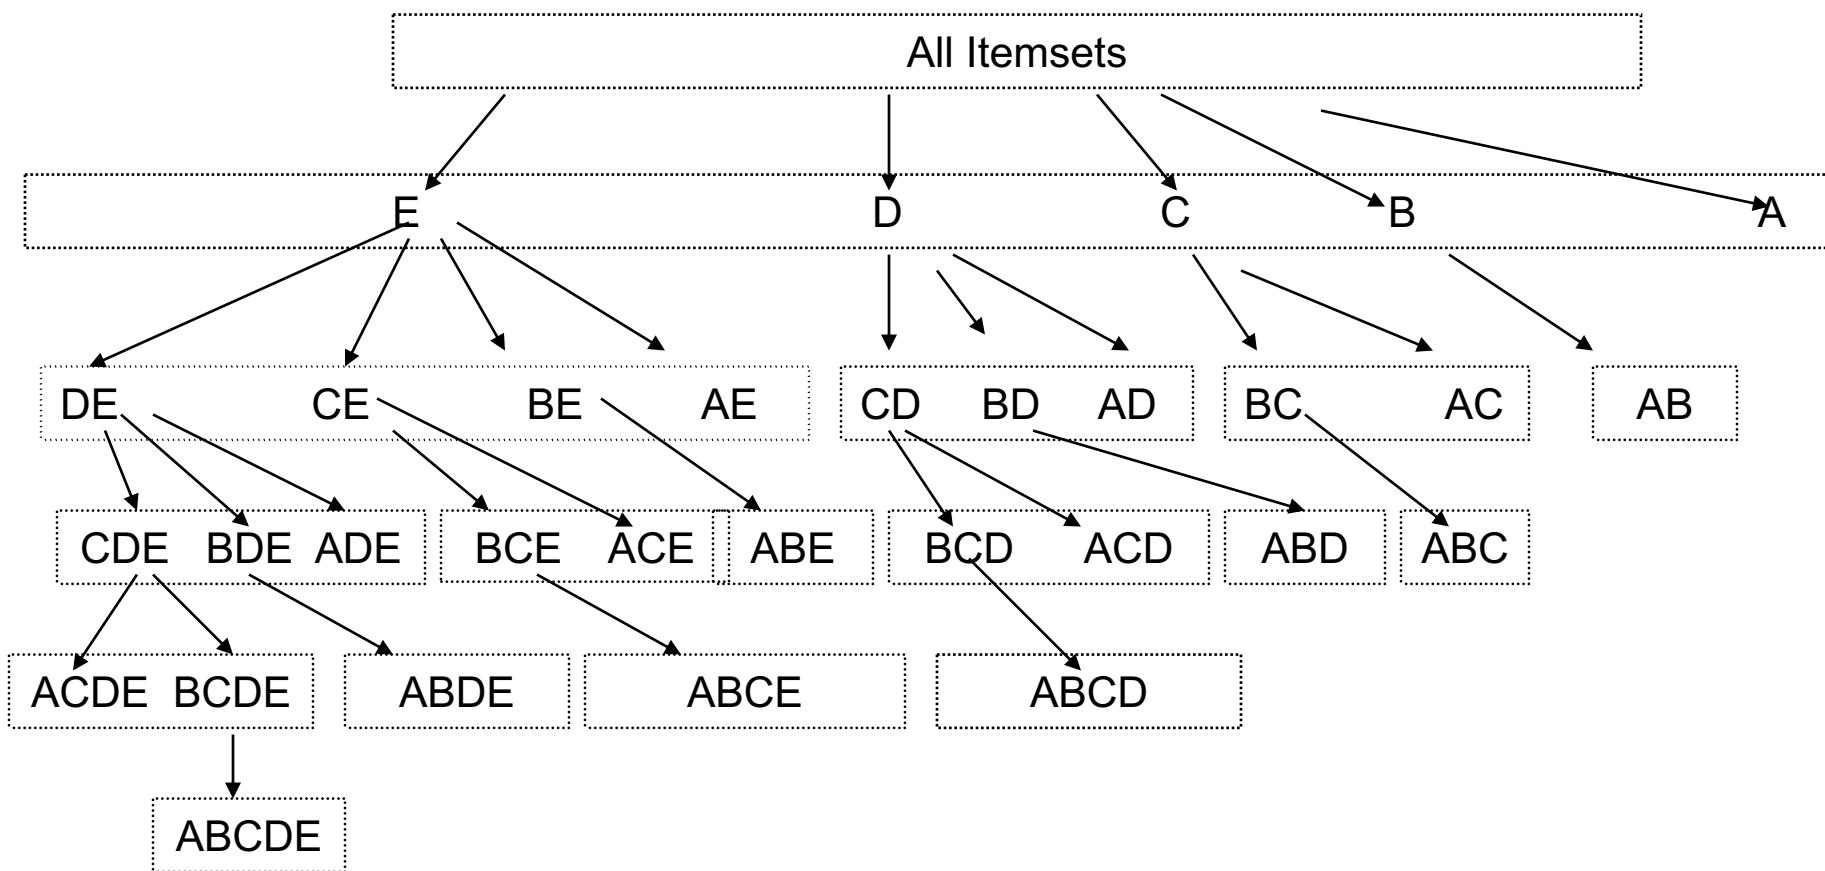

| TID | Items |
|-----|-----------|
| 1 | {B,A} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {B,A,C} |
| 6 | {B,A,C,D} |
| 7 | {B,C} |
| 8 | {B,A,C} |
| 9 | {B,A,D} |
| 10 | {B,C,E} |

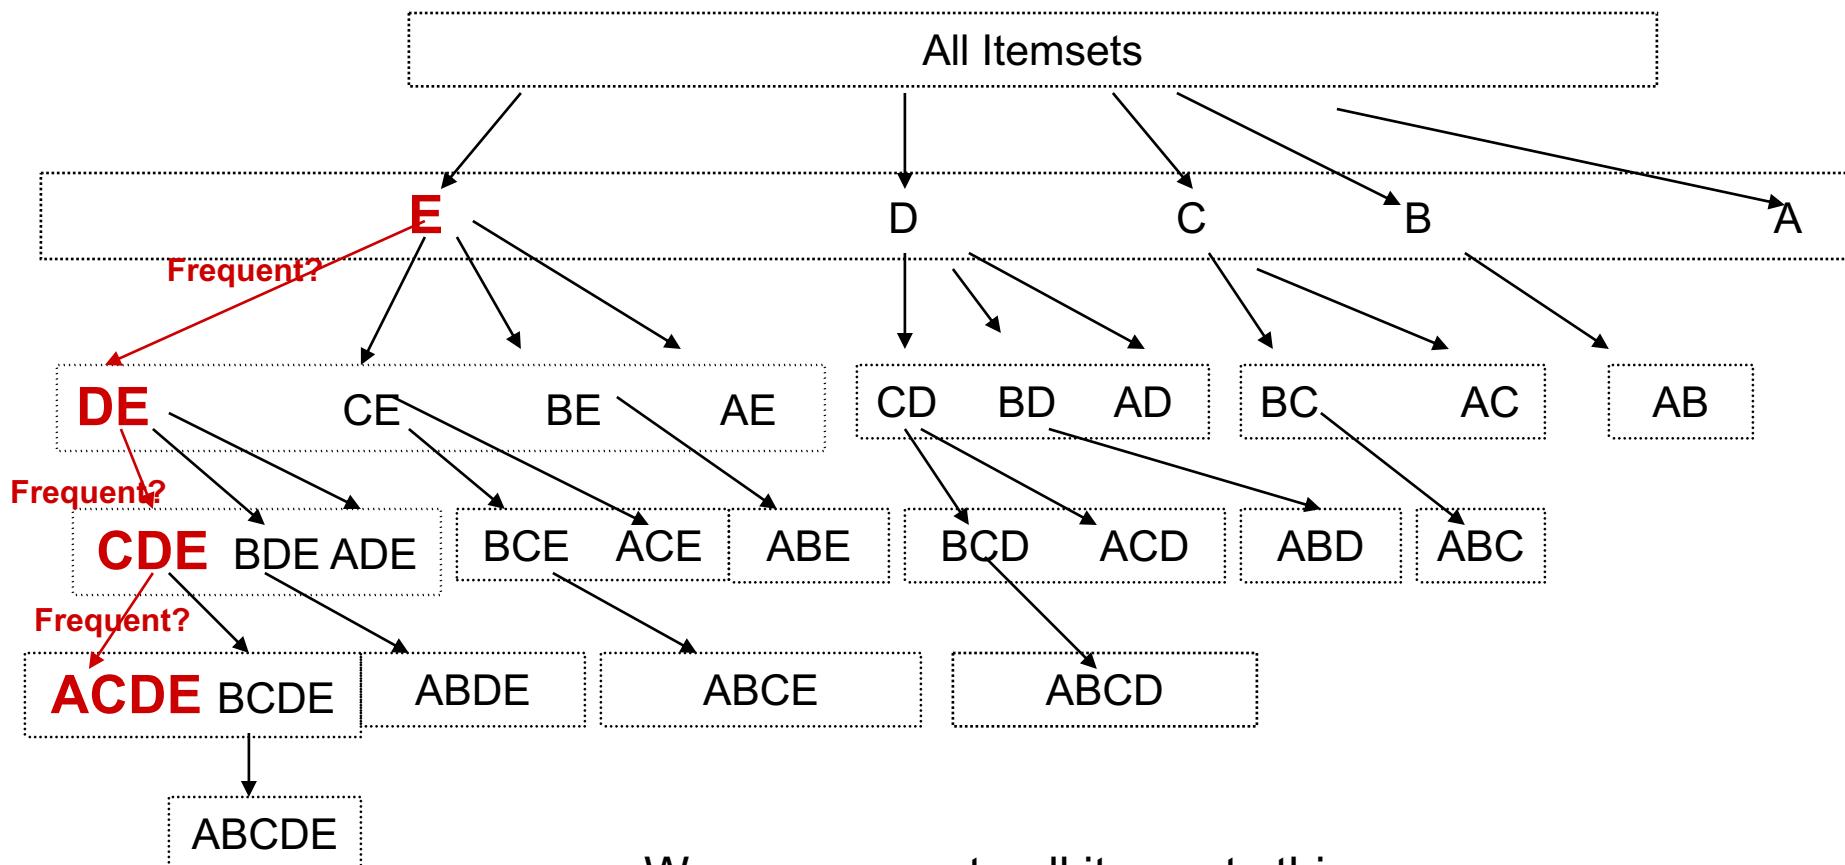

Finding Frequent Itemsets

- **Input:** The FP-tree
- **Output:** All Frequent Itemsets and their support
- **Method:** Divide and Conquer:
 - Consider all itemsets that **end** in: E, D, C, B, A
 - For each possible ending item, consider the itemsets with last item equal to one of items preceding it in the ordering
 - E.g, for E, consider all itemsets with last item D, C, B, A. In this way we get all the itemsets ending at DE, CE, BE, AE
 - Proceed recursively this way.
 - Do this for all items.

Frequent itemsets

Frequent Itemsets

We can generate all itemsets this way
We expect the FP-tree to contain a lot less

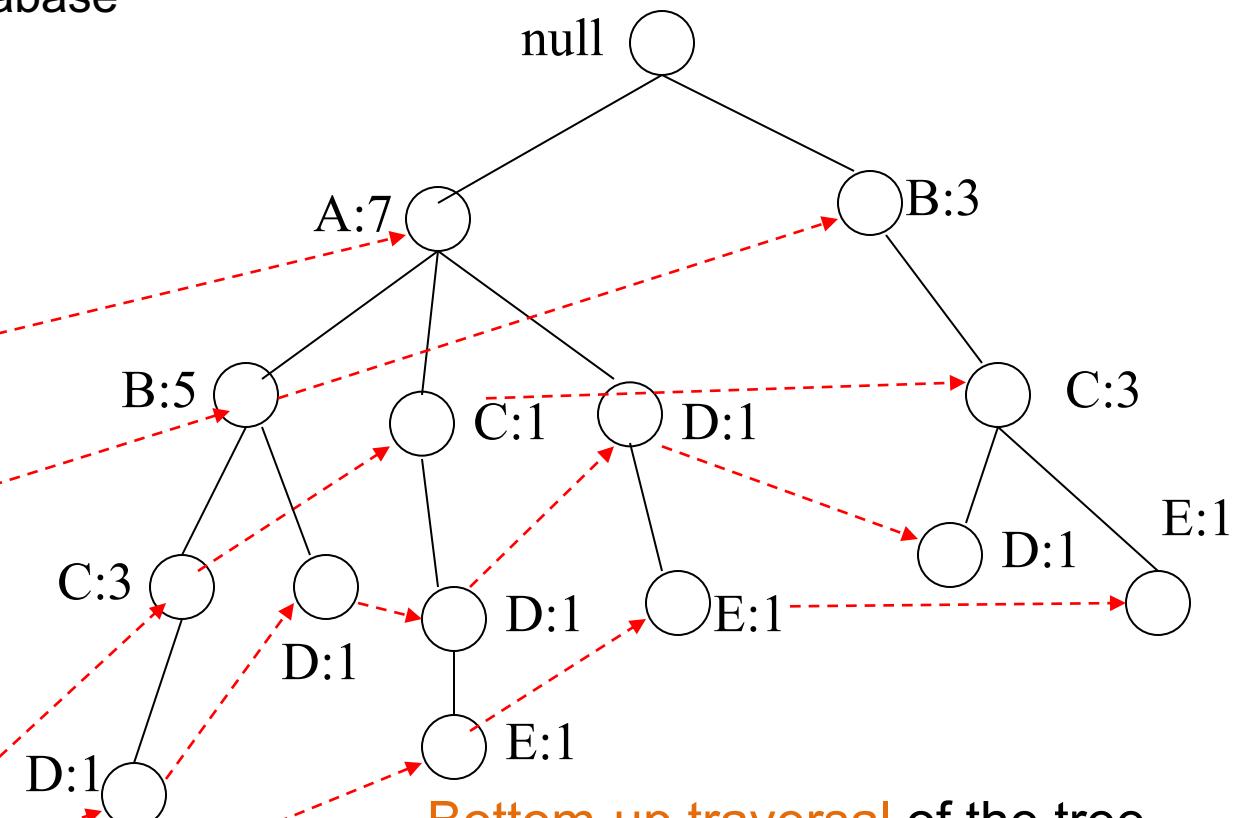

Using the FP-tree to find frequent itemsets

| TID | Items |
|-----|-----------|
| 1 | {A,B} |
| 2 | {B,C,D} |
| 3 | {A,C,D,E} |
| 4 | {A,D,E} |
| 5 | {A,B,C} |
| 6 | {A,B,C,D} |
| 7 | {B,C} |
| 8 | {A,B,C} |
| 9 | {A,B,D} |
| 10 | {B,C,E} |

Transaction Database

Header table

| Item | Pointer |
|------|---------|
| A | |
| B | |
| C | |
| D | |
| E | |

Bottom-up traversal of the tree.

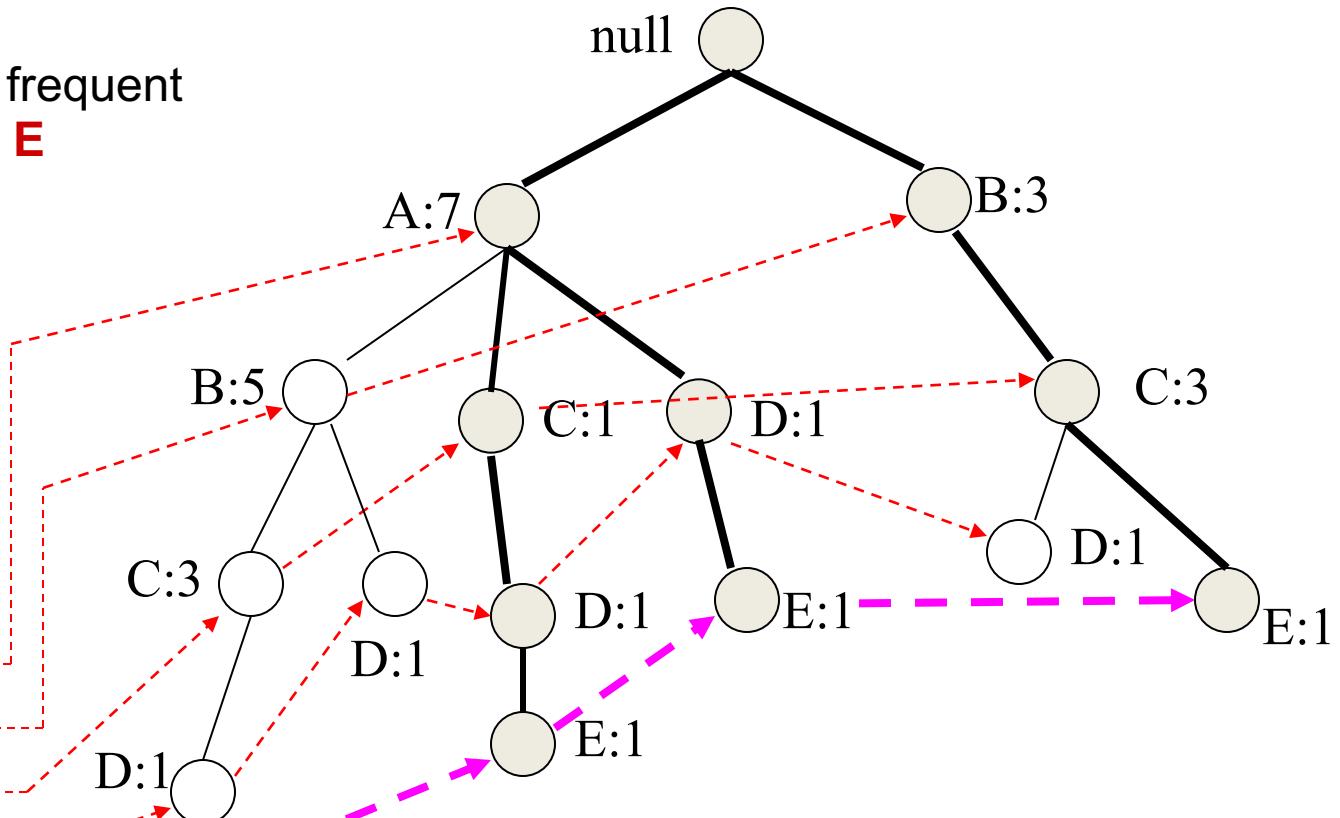

First, itemsets ending in E, then D, etc, each time a suffix-based class

Finding Frequent Itemsets

Subproblem: find frequent itemsets ending in E

Header table

| Item | Pointer |
|------|-----------|
| A | - - - - - |
| B | - - - - - |
| C | - - - - - |
| D | - - - - - |
| E | - - - - - |

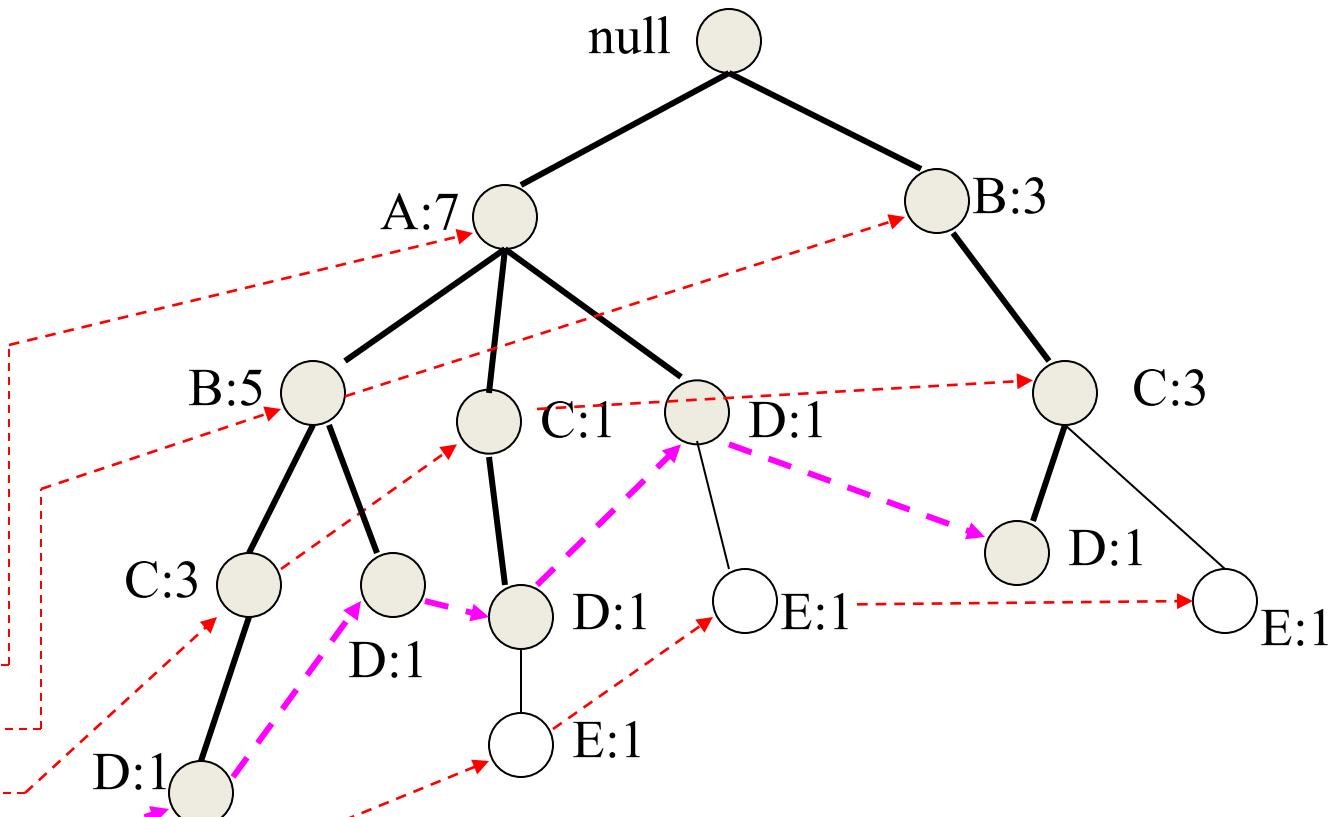

- We will then see how to compute the support for the possible itemsets

Finding Frequent Itemsets

Ending in **D**

Header table

| Item | Pointer |
|------|-----------|
| A | - - - - - |
| B | - - - - - |
| C | - - - - - |
| D | - - - - - |
| E | - - - - - |

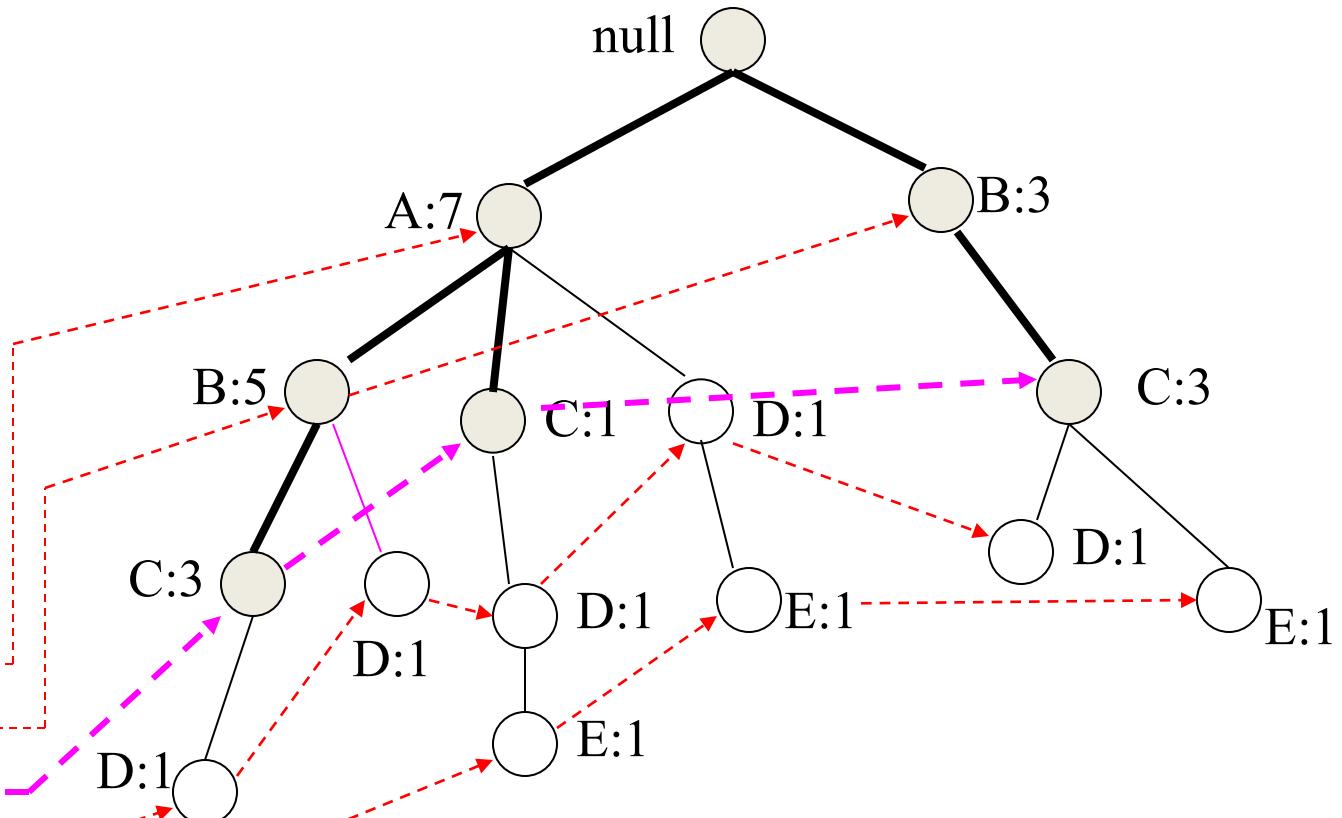

Finding Frequent Itemsets

Ending in **C**

Header table

| Item | Pointer |
|------|-----------|
| A | - - - - - |
| B | - - - - - |
| C | - - - - - |
| D | - - - - - |
| E | - - - - - |

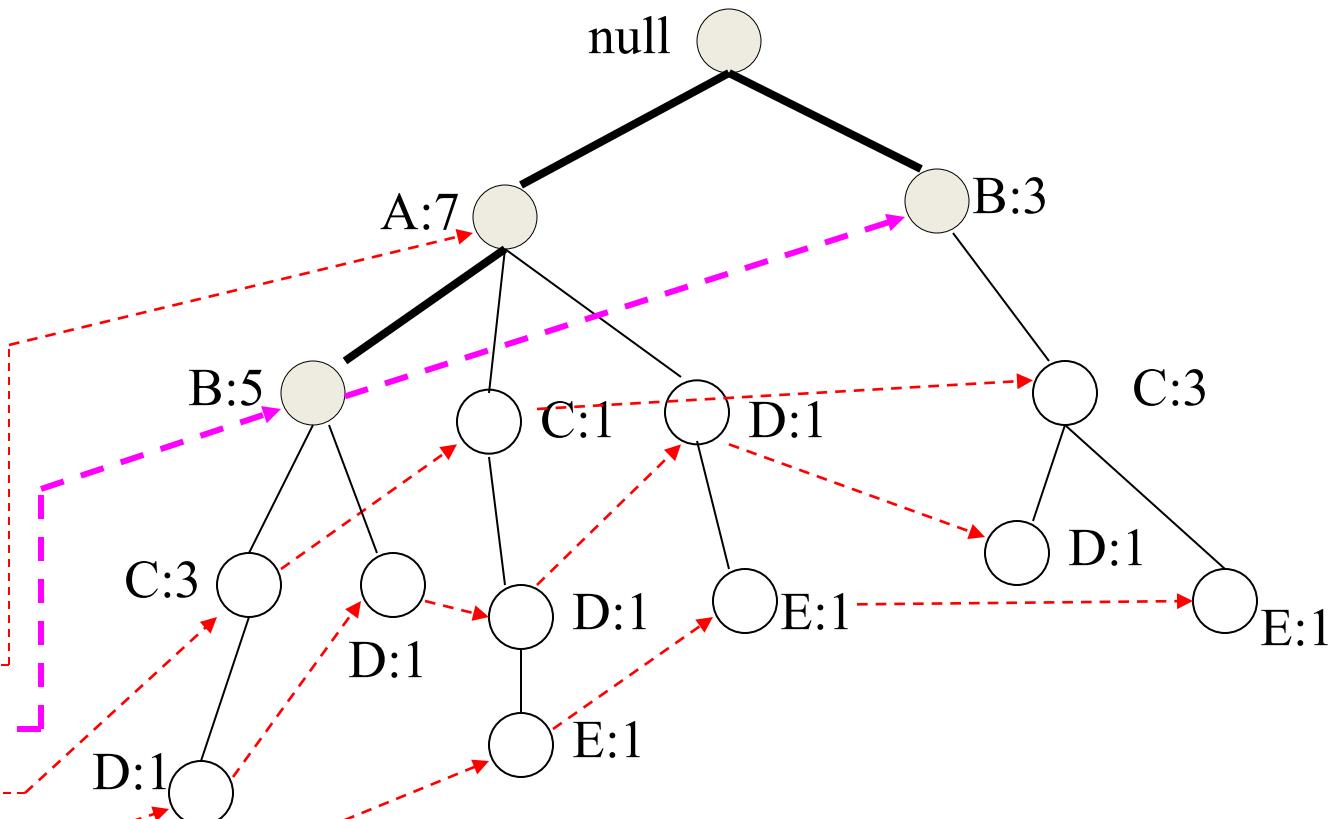

Finding Frequent Itemsets

Ending in **B**

Header table

| Item | Pointer |
|------|---------|
| A | |
| B | - - - |
| C | |
| D | |
| E | |

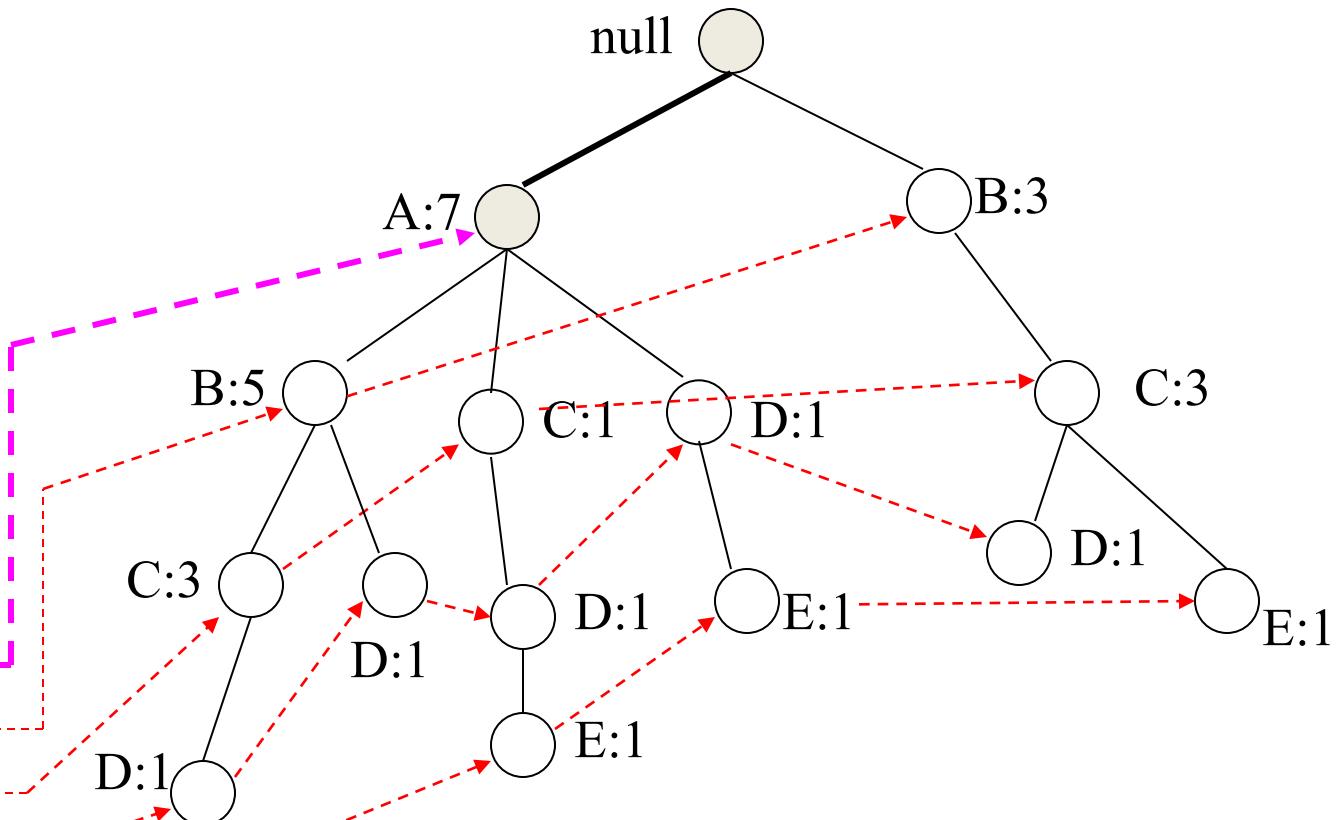

Finding Frequent Itemsets

Ending in **A**

Header table

| Item | Pointer |
|------|-----------|
| A | - - - - - |
| B | - - - - - |
| C | - - - - - |
| D | - - - - - |
| E | - - - - - |

Algorithm

- For each **suffix X**
- Phase 1
 - Construct the **prefix tree** for X as shown before, and compute the **support** using the header table and the pointers
- Phase 2
 - If X is frequent, construct the **conditional FP-tree** for X in the following steps
 1. Recompute support
 2. Prune infrequent items
 3. Prune leaves and recurse

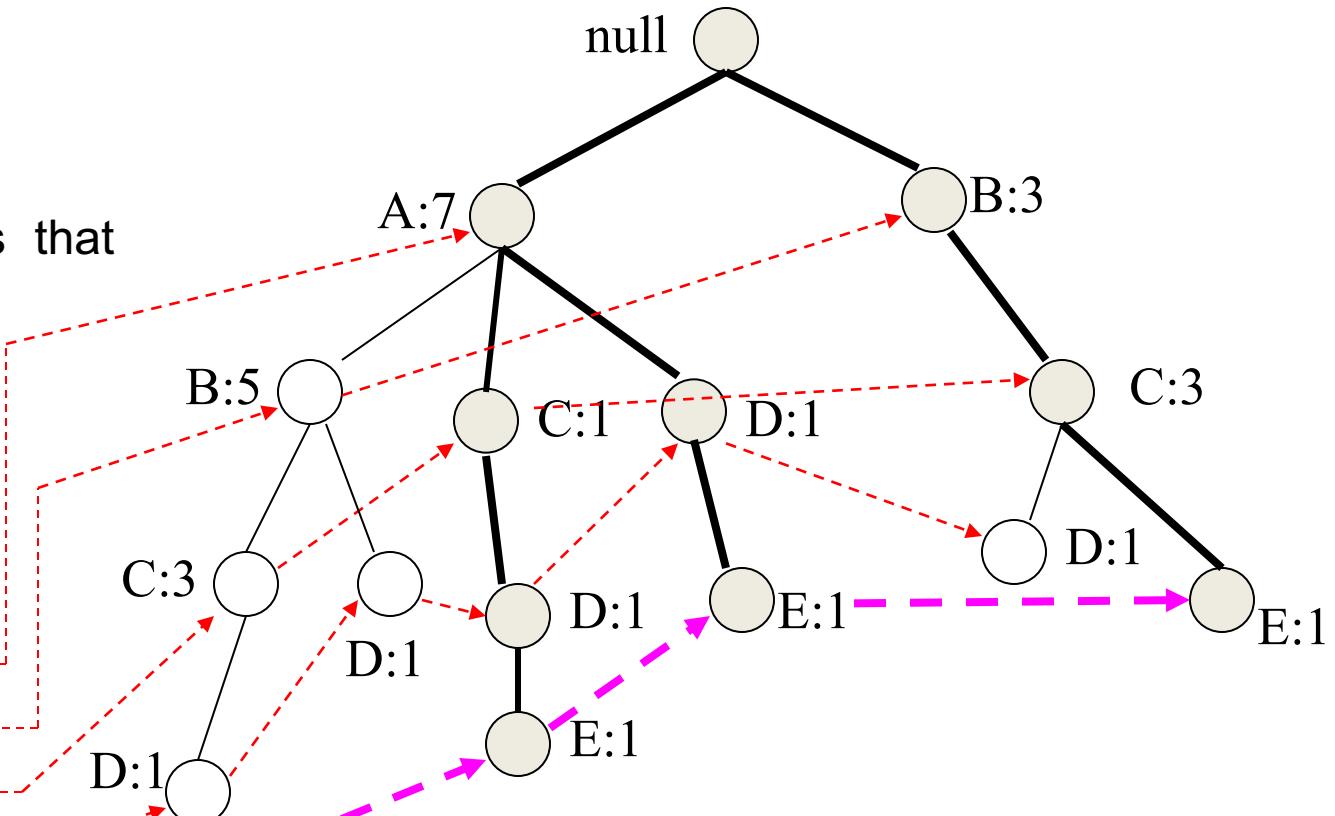

Example

Phase 1 – construct prefix tree

Find all prefix paths that contain E

Header table

| Item | Pointer |
|------|---------|
| A | |
| B | |
| C | |
| D | |
| E | ----- |

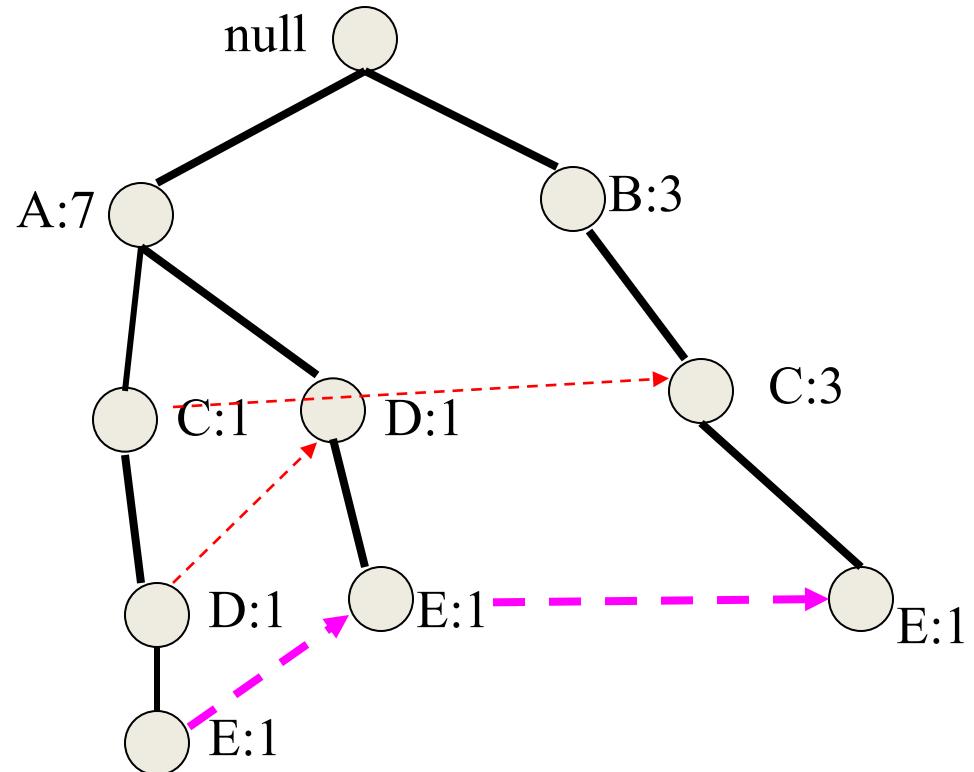

Suffix Paths for E:

{A,C,D,E}, {A,D,E}, {B,C,E}

Example

Phase 1 – construct prefix tree

Find all prefix paths that contain E

Prefix Paths for E:

{A,C,D,E}, {A,D,E}, {B,C,E}

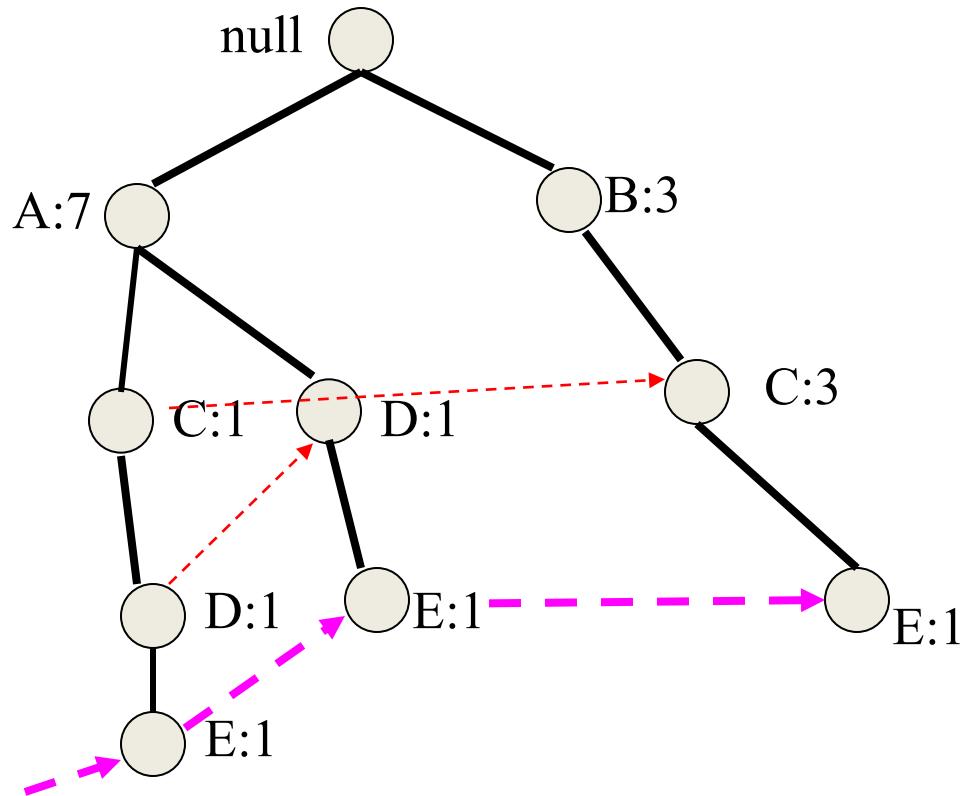

Example

Compute Support for E
(minsup = 2)

How?

Follow pointers while
summing up counts:
 $1+1+1 = 3 > 2$

E is frequent

{E} is frequent so we can now consider **suffixes DE, CE, BE, AE**

Example

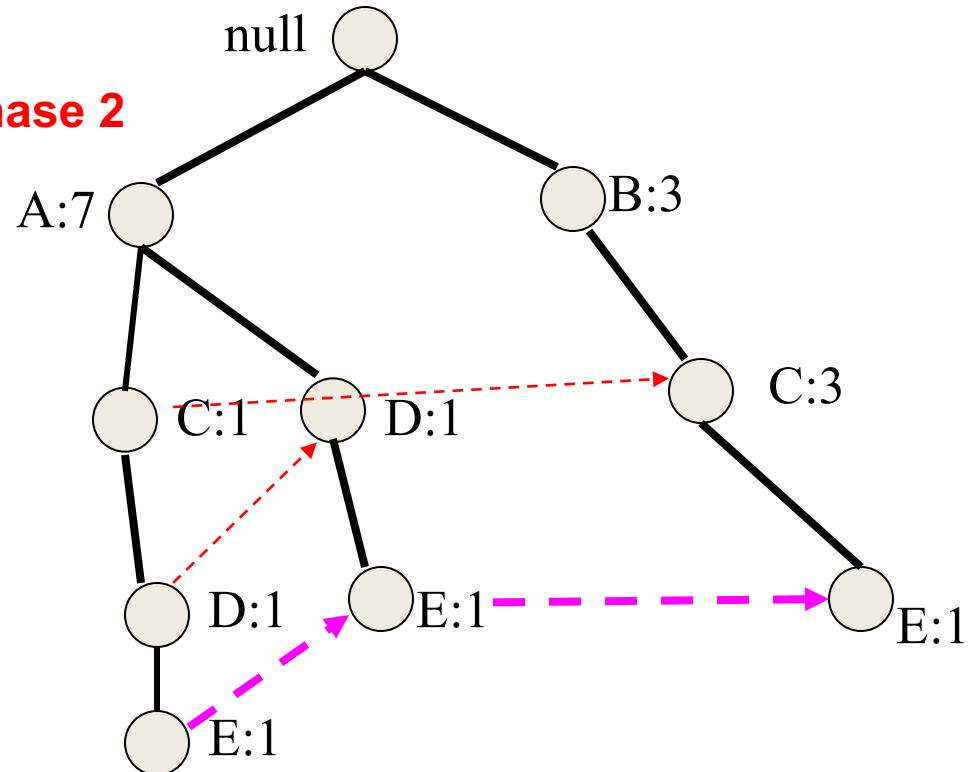

E is frequent so we proceed with Phase 2

Phase 2

Convert the prefix tree of E into a conditional FP-tree

Two changes

- (1) Recompute support
- (2) Prune infrequent

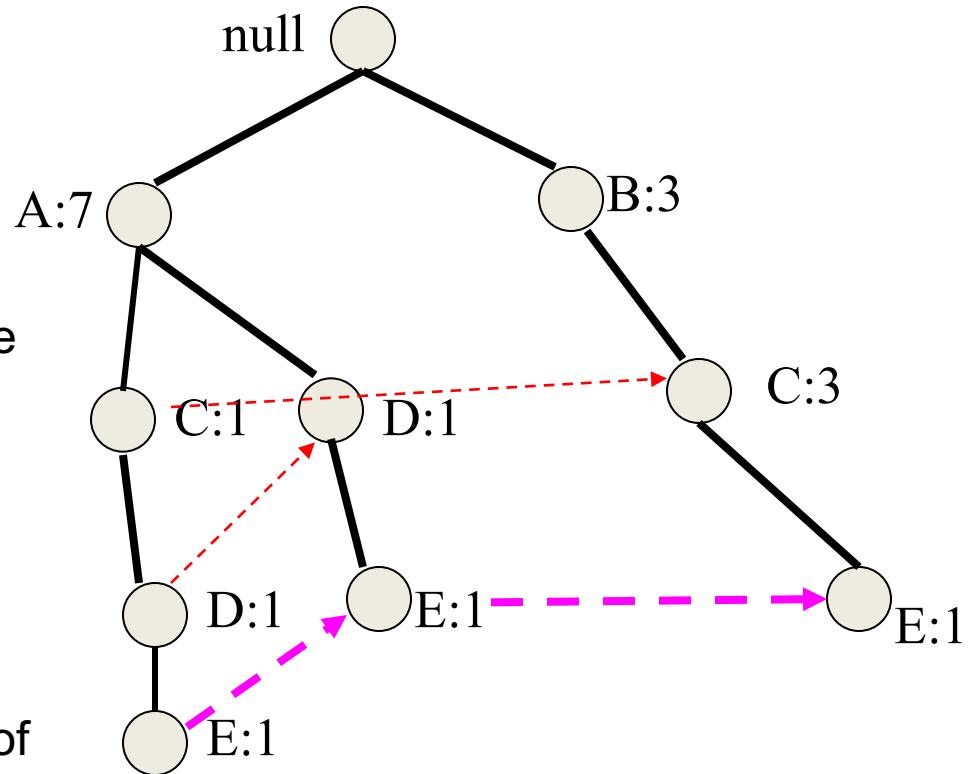

Example

Recompute Support

The support counts for some of the nodes include transactions that do not end in E

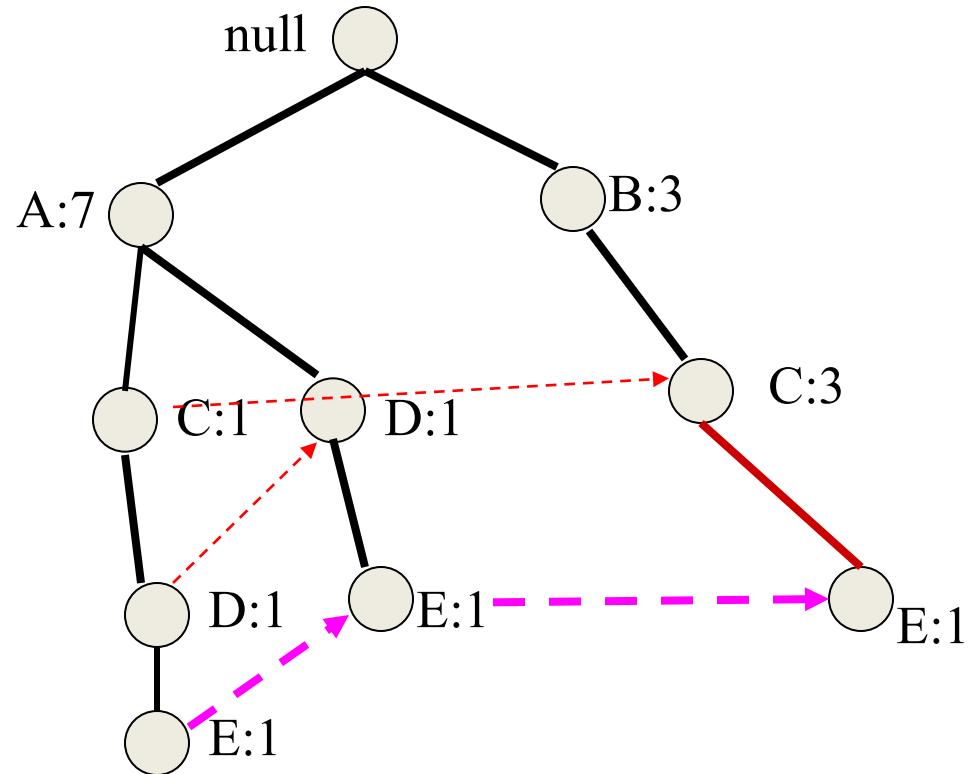

For example in null->B->C->E we count {B, C}

Property to satisfy: The support of any node is equal to the sum of the support of leaves with label E in its subtree

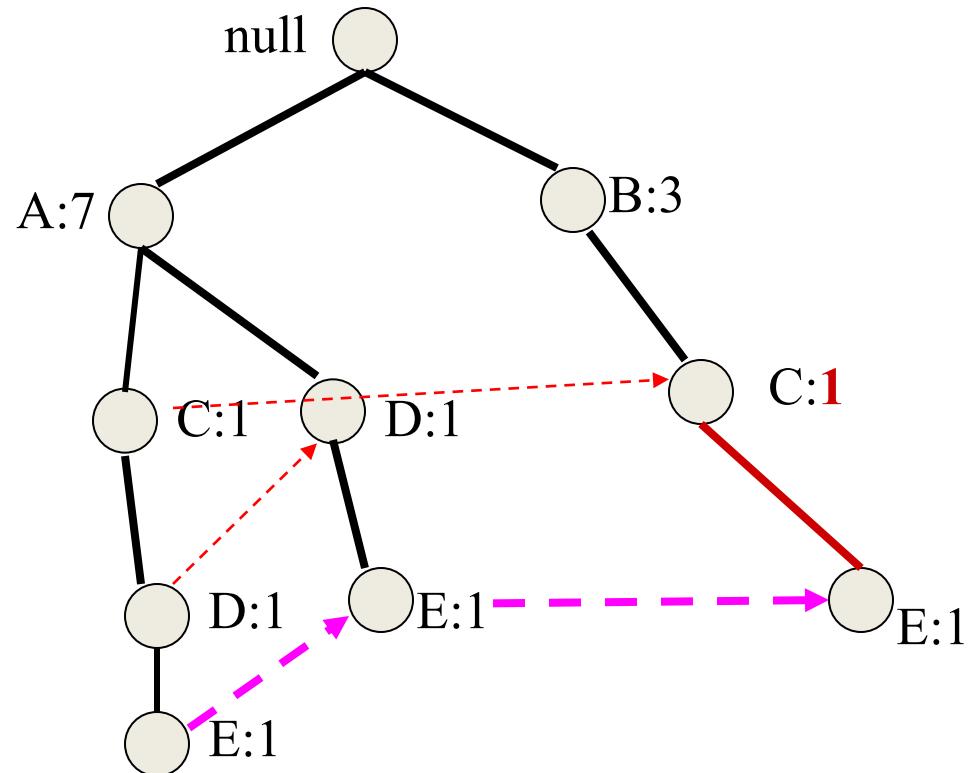

Example

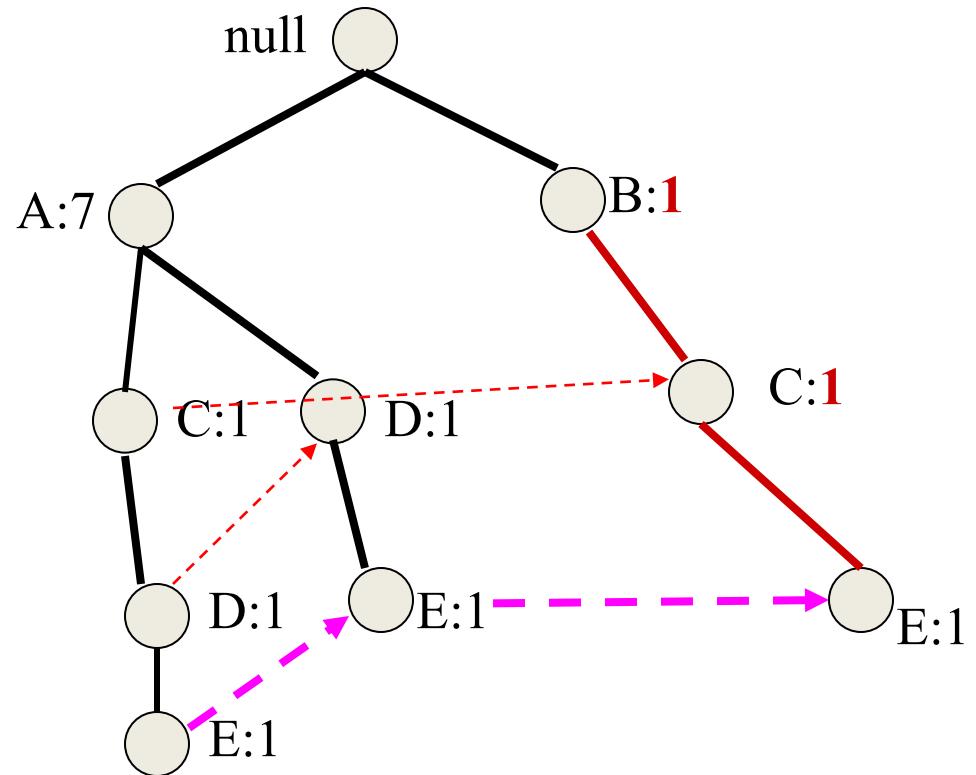

The support of any node is equal to the sum of the support of leaves with label E in its subtree

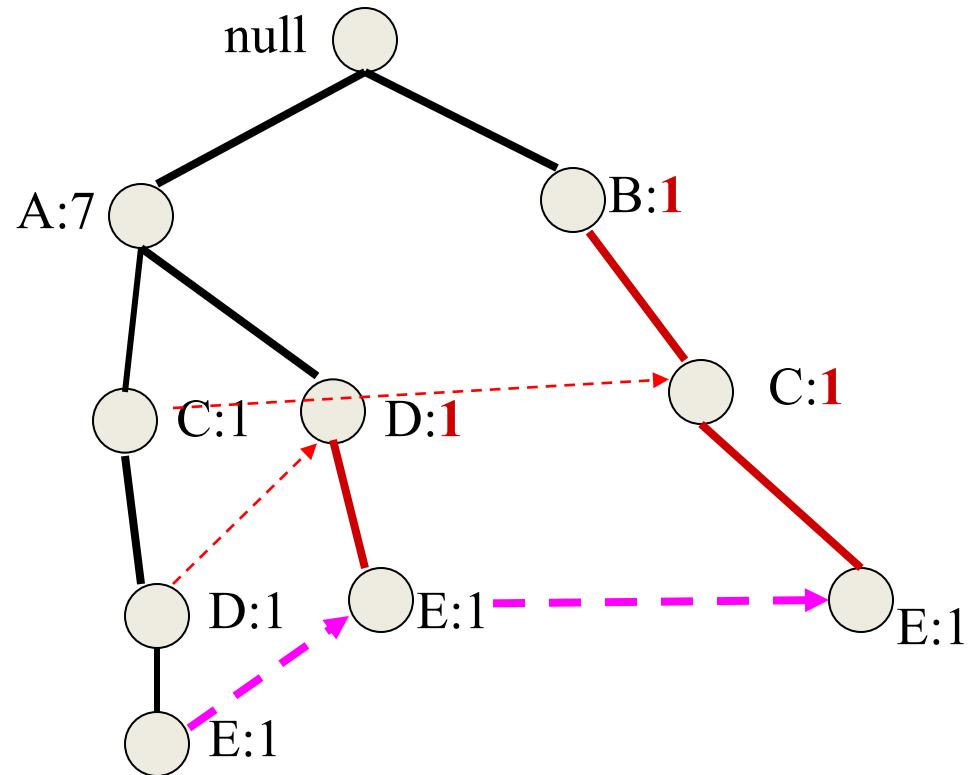

Example

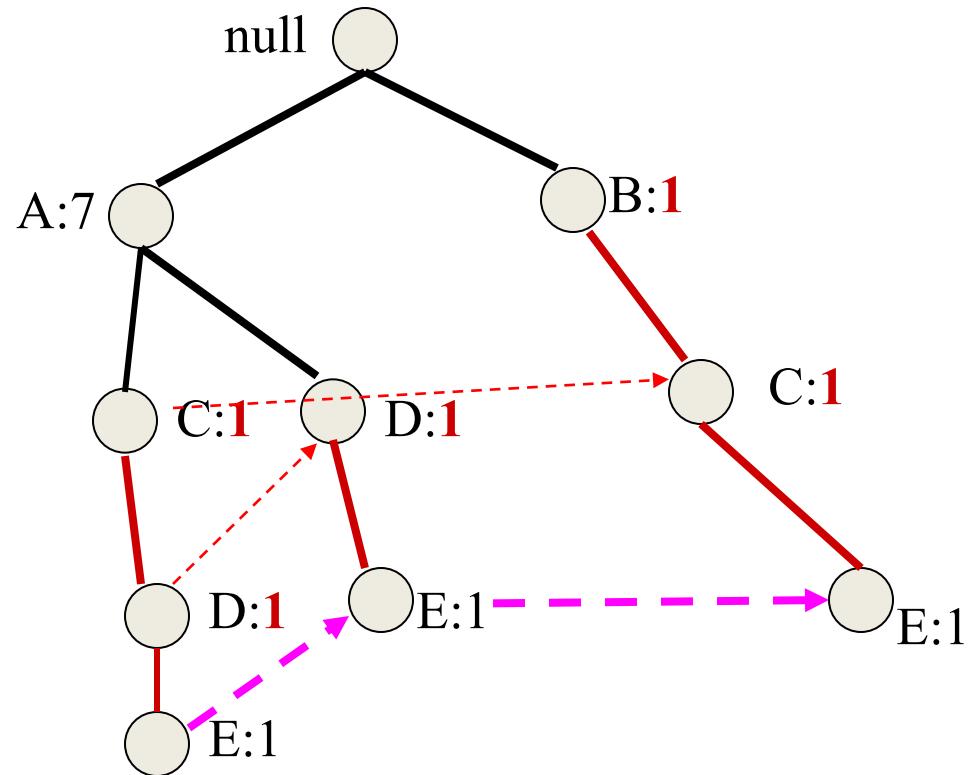

Example

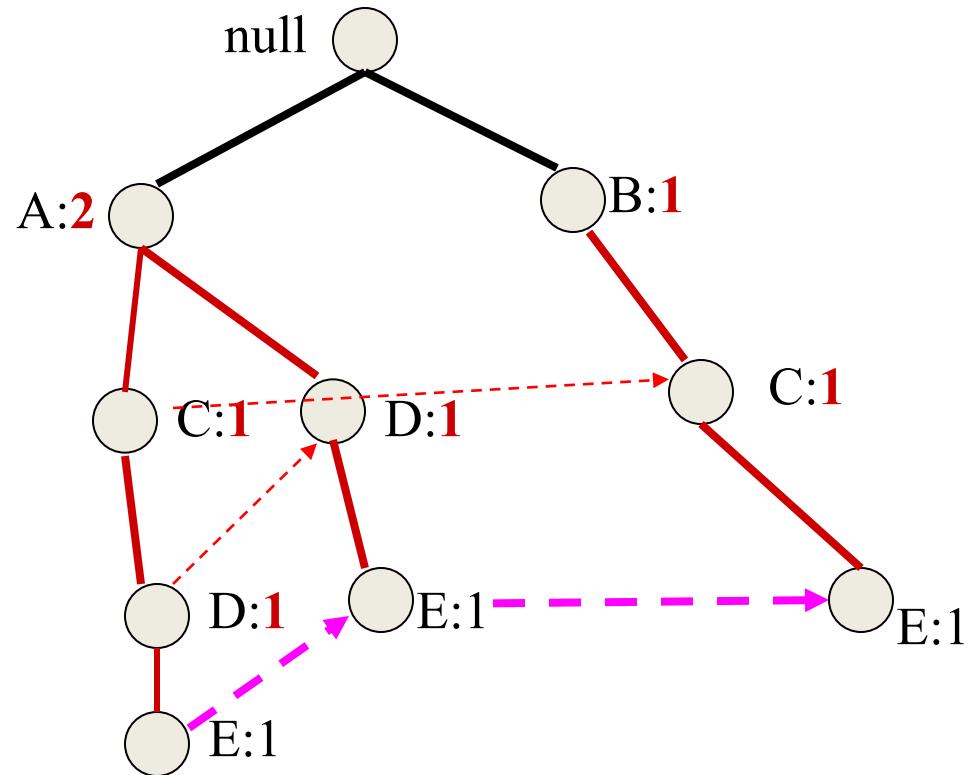

Example

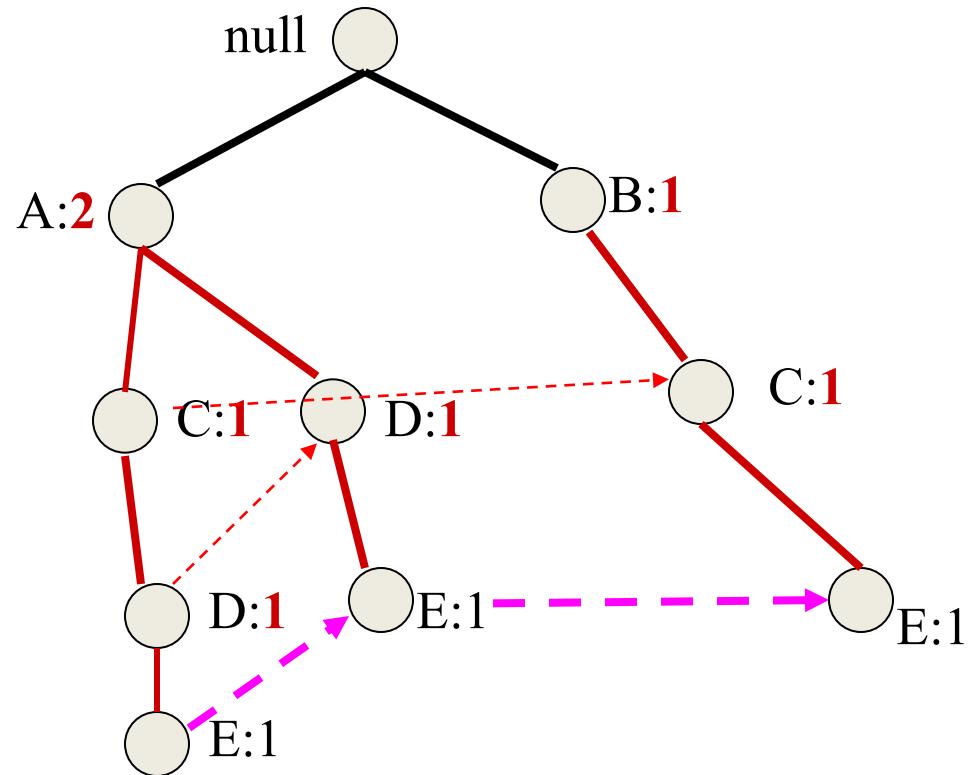

Example

Example

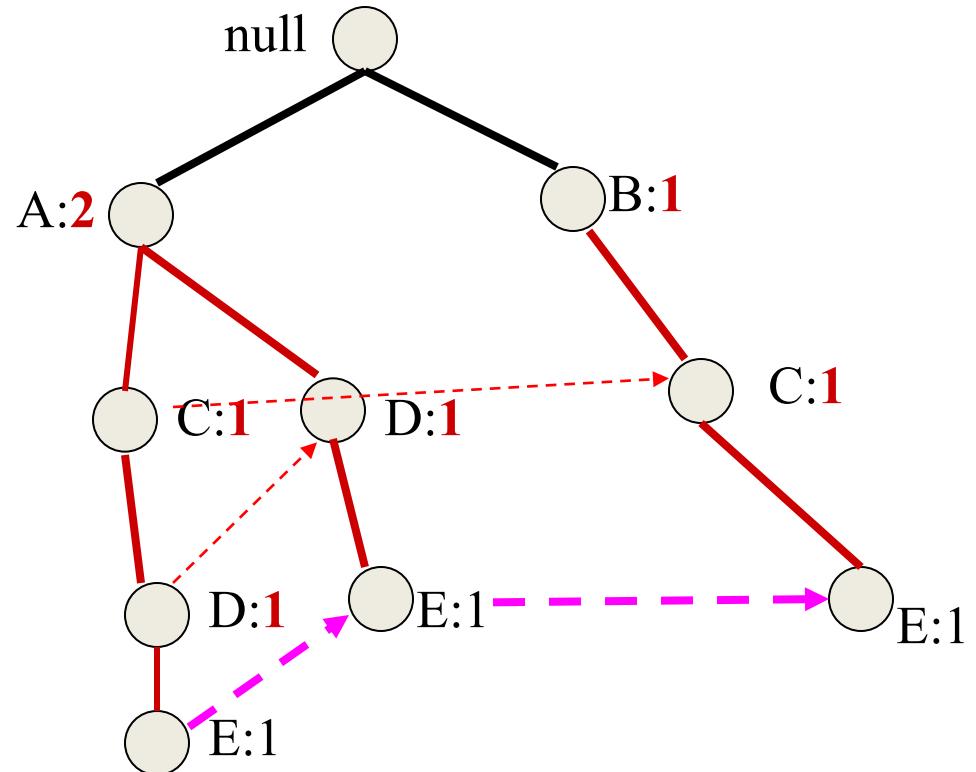

Example

Example

Truncate

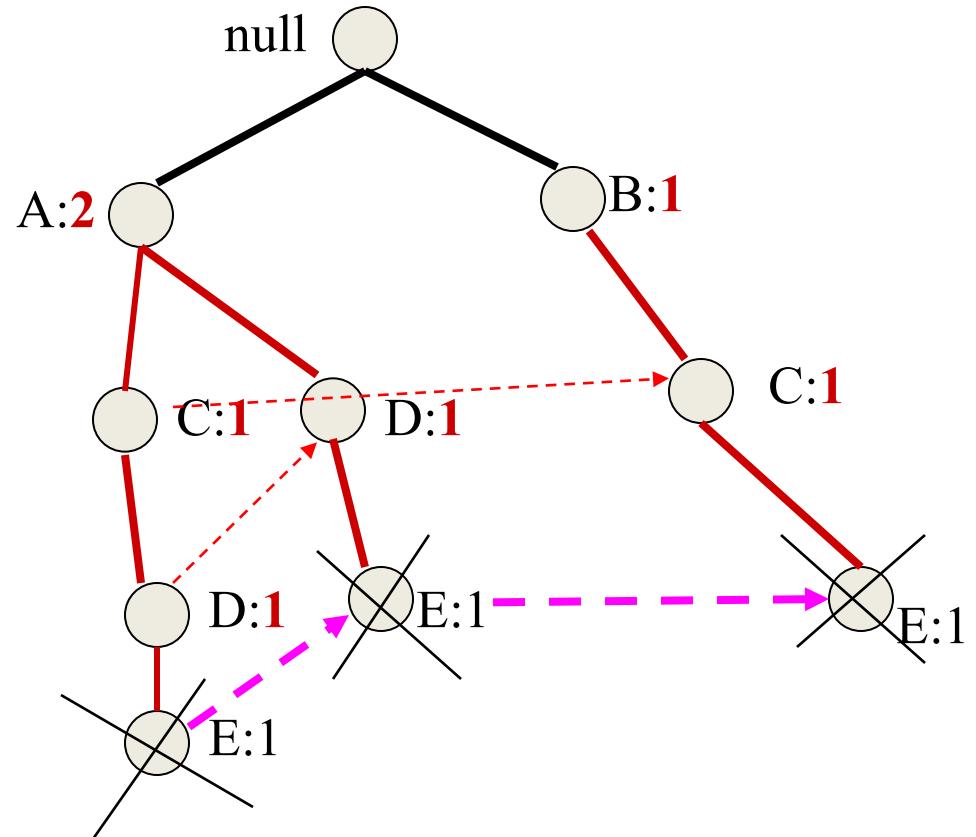

Delete the nodes of E

Example

Truncate

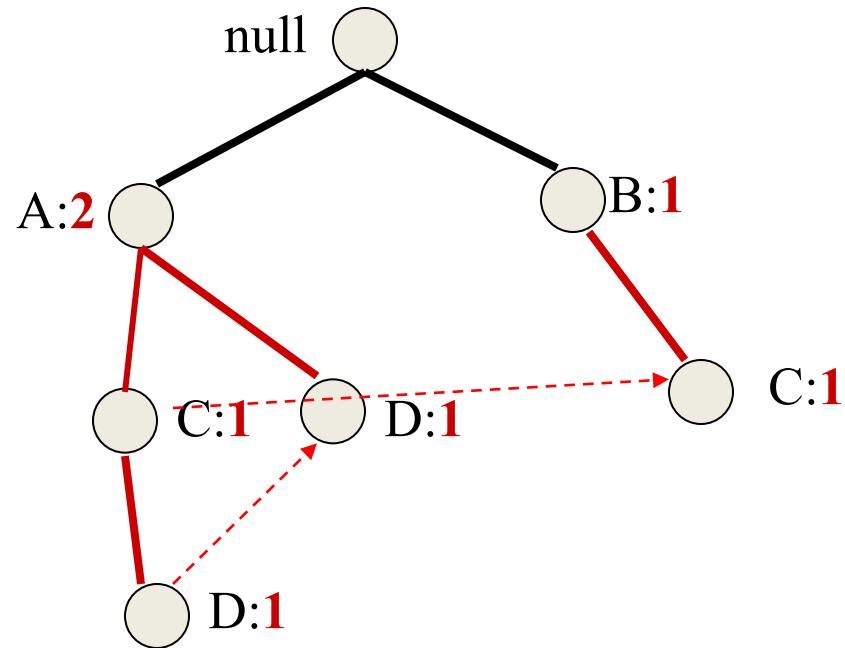

Delete the nodes of E

Example

Truncate

Delete the nodes of E

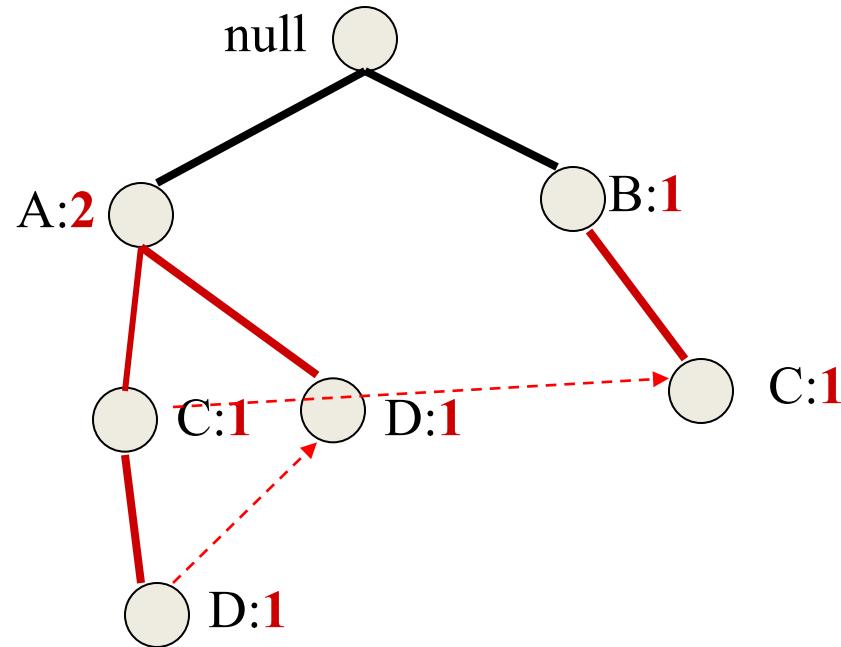

Example

Prune infrequent

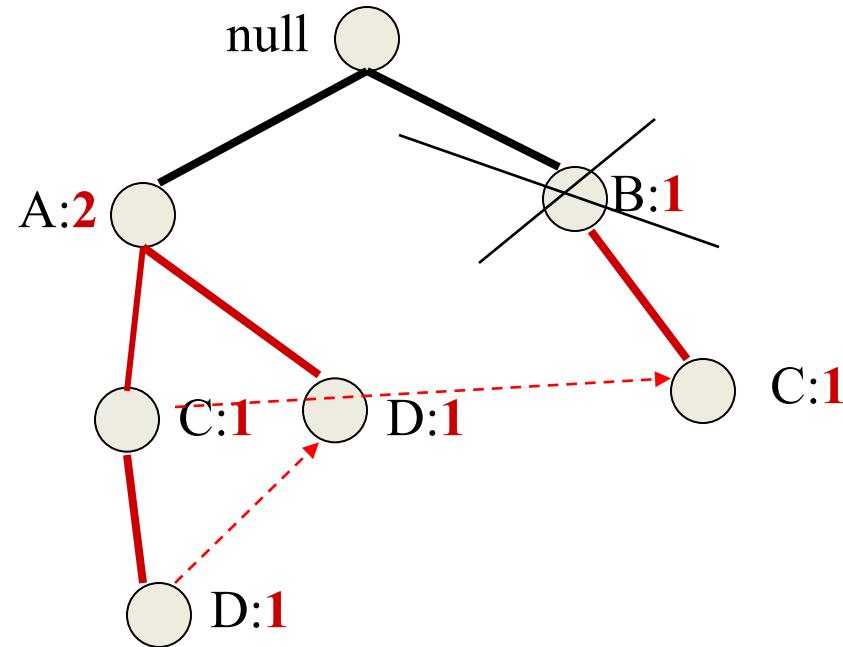

In the conditional FP-tree
some nodes may have
support less than minsup

e.g., B needs to be pruned

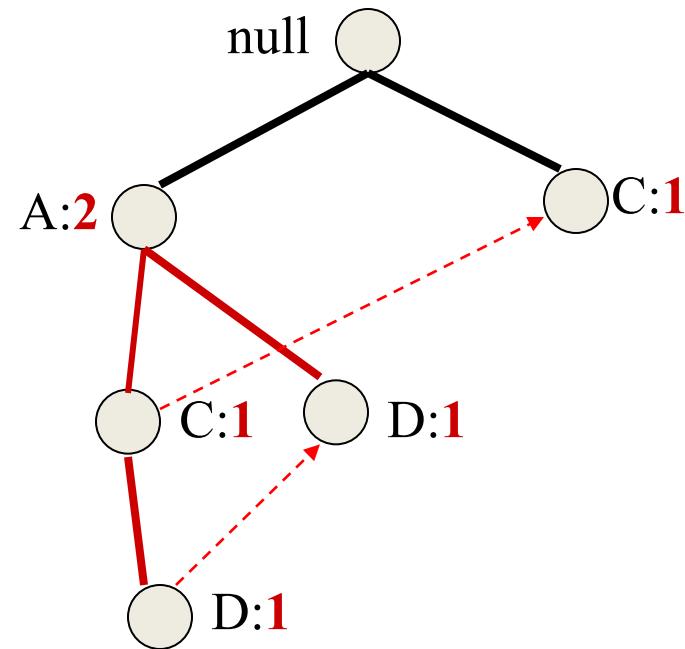

This means that B appears
with E less than minsup
times

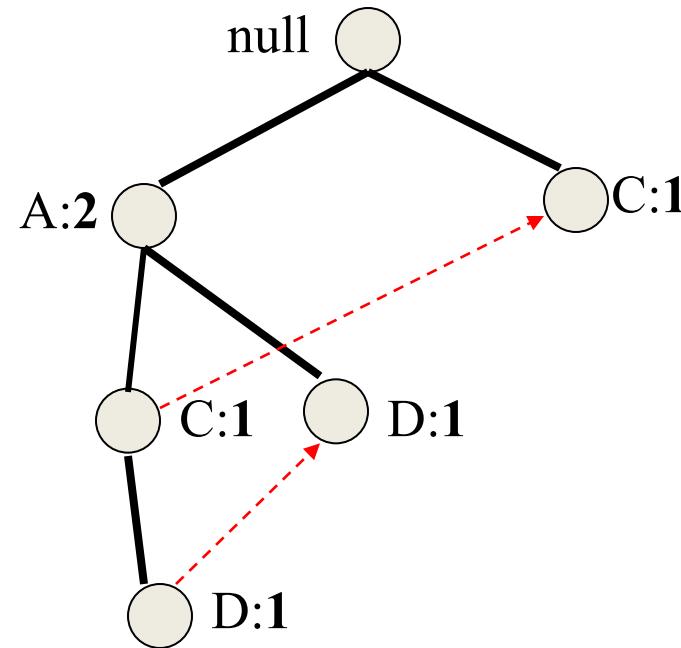

Example

Example

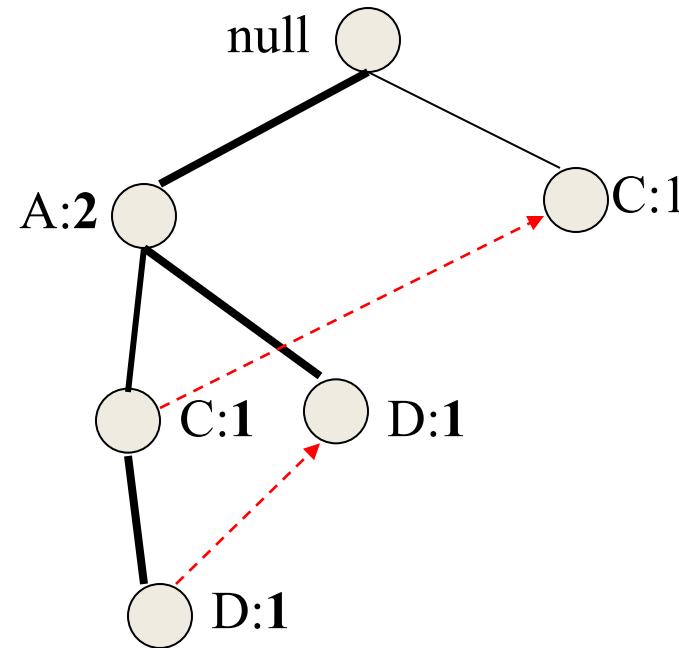

Example

The conditional FP-tree for E

Repeat the algorithm for {D, E}, {C, E}, {A, E}

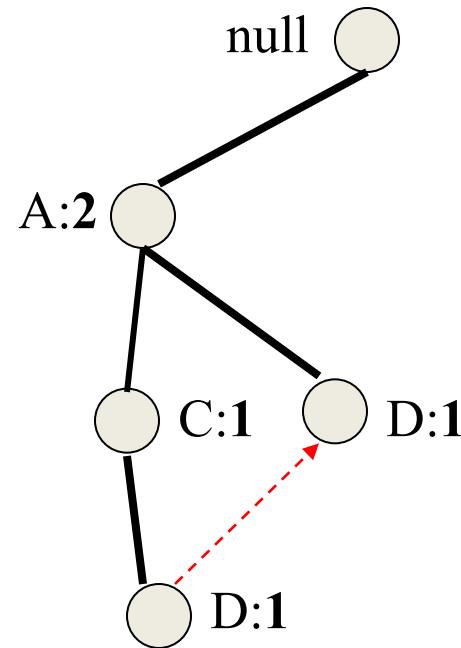

Example

Phase 1

Find all prefix paths that contain D (DE) in the conditional FP-tree

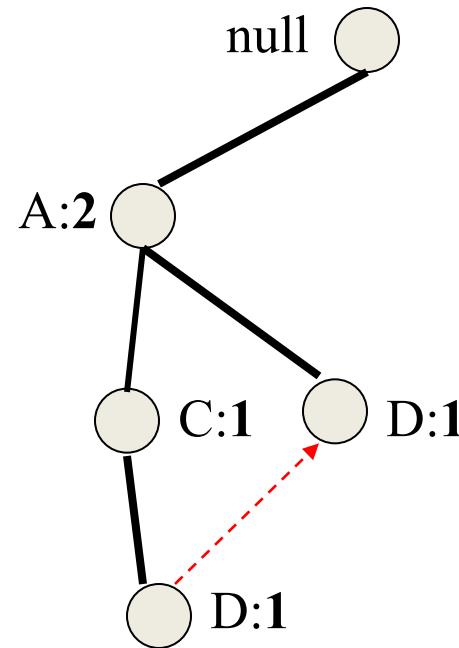

Example

Phase 1

Find all prefix paths that contain D (DE) in the conditional FP-tree

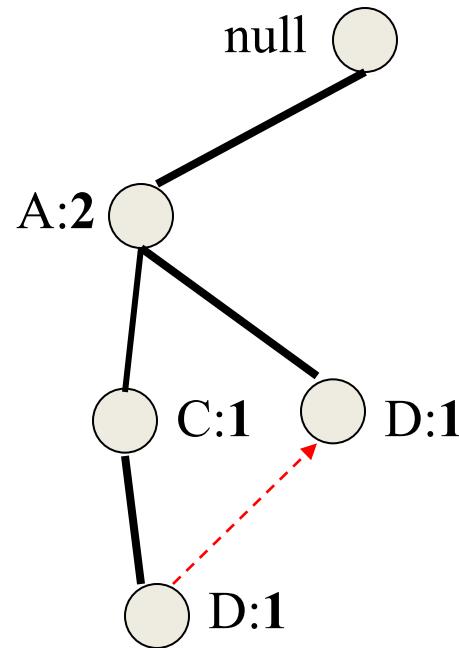

Example

Compute the support of {D,E} by following the pointers in the tree
 $1+1 = 2 \geq 2 = \text{minsup}$

{D,E} is frequent

Example

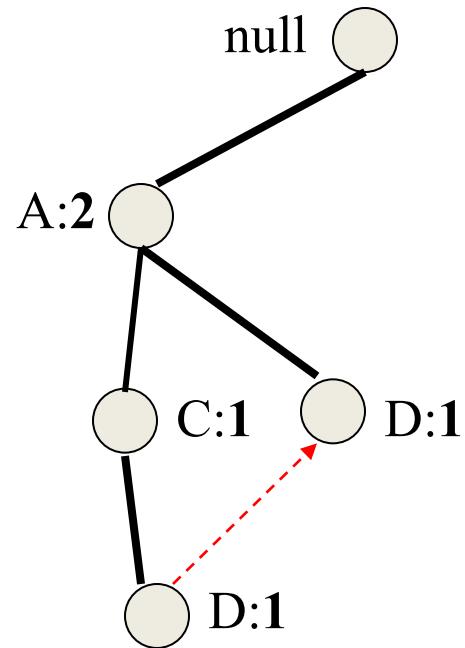

Phase 2

Construct the conditional FP-tree

1. Recompute Support
2. Prune nodes

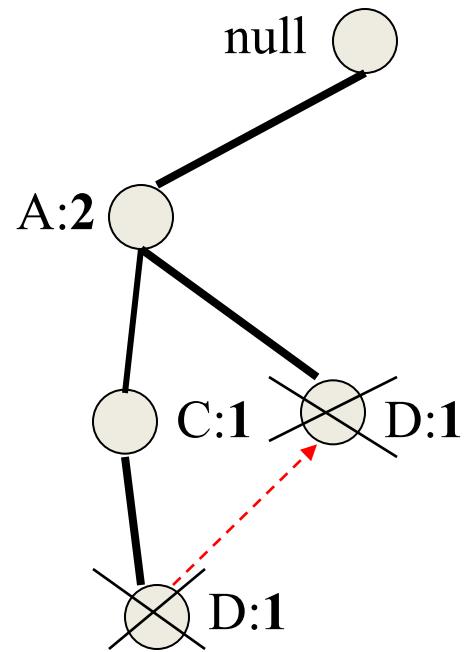

Example

Recompute support

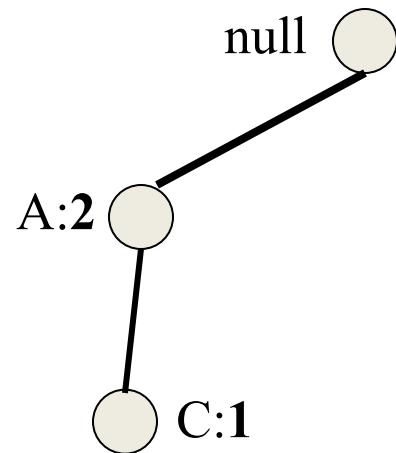

Example

Prune nodes

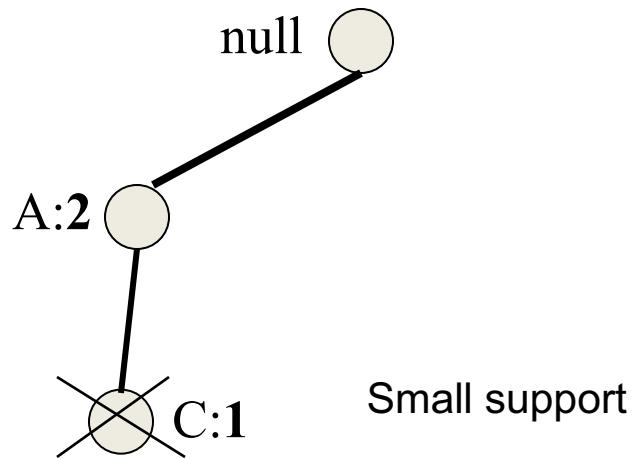

Example

Prune nodes

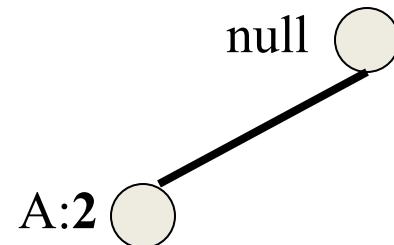

Example

Prune nodes

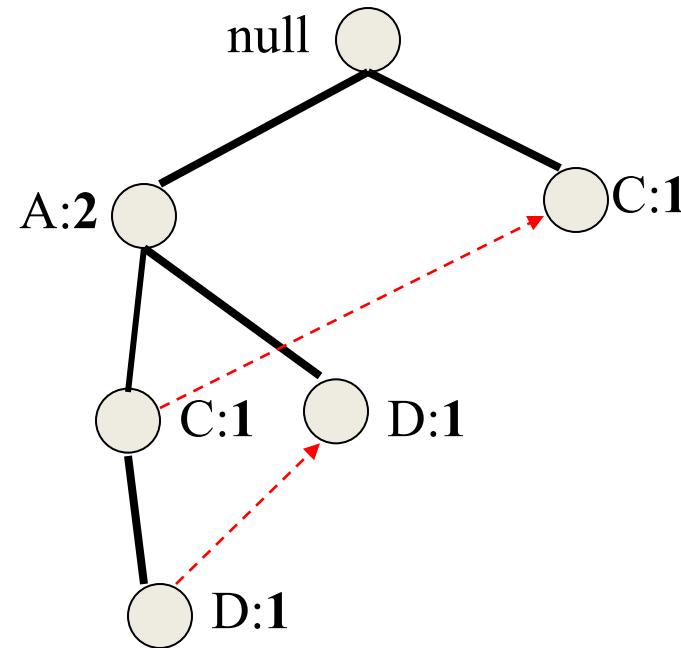

Example

Final condition FP-tree for {D,E}

The support of A is $\geq \text{minsup}$ so {A,D,E} is frequent
Since the tree has a single node we return to the next subproblem

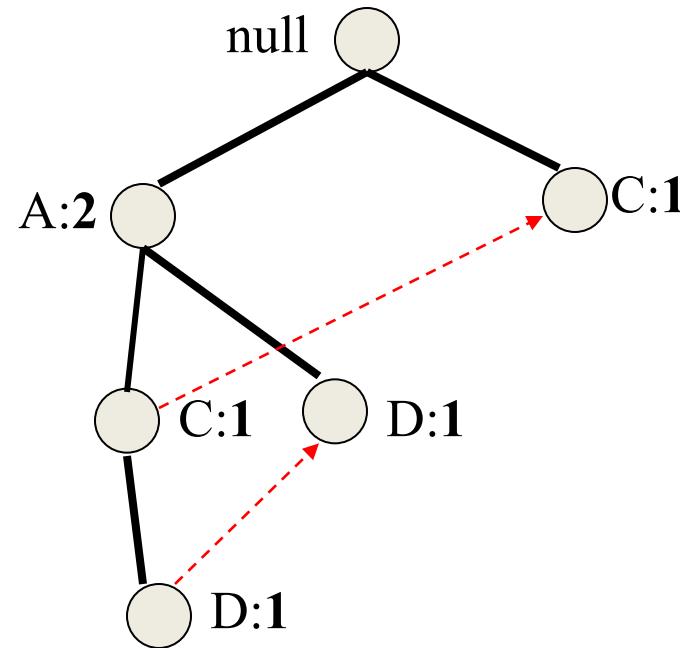

Example

The conditional FP-tree for E

We repeat the algorithm for ~~{D,E}~~, {C,E}, {A,E}

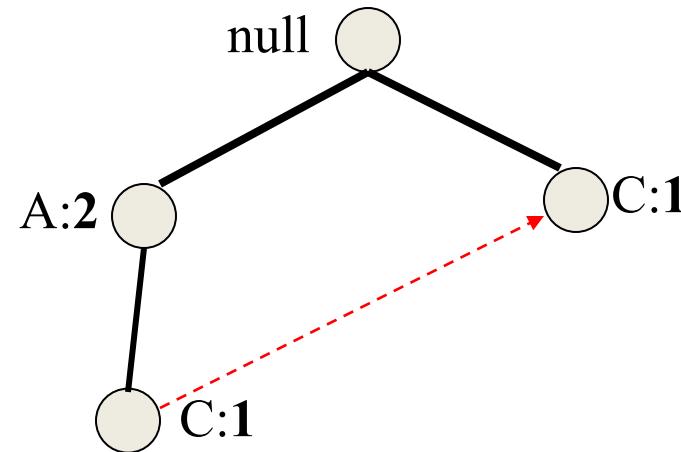

Example

Phase 1

Find all prefix paths that contain C (CE) in the conditional FP-tree

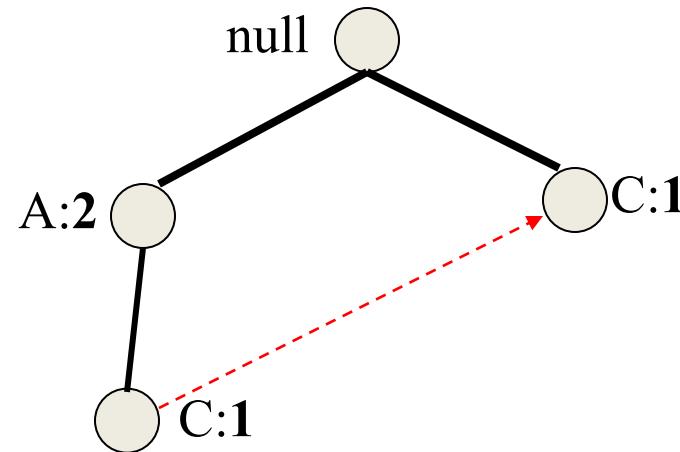

Example

Phase 1

Find all prefix paths that contain C (CE) in the conditional FP-tree

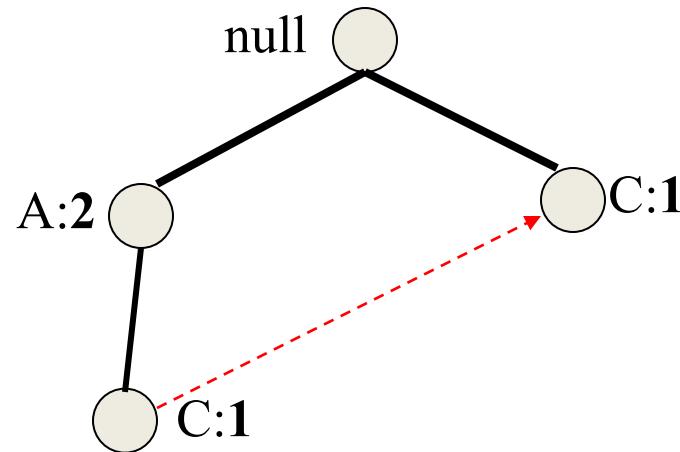

Example

Compute the support of {C,E} by following the pointers in the tree
 $1+1 = 2 \geq 2 = \text{minsup}$

{C,E} is frequent

Example

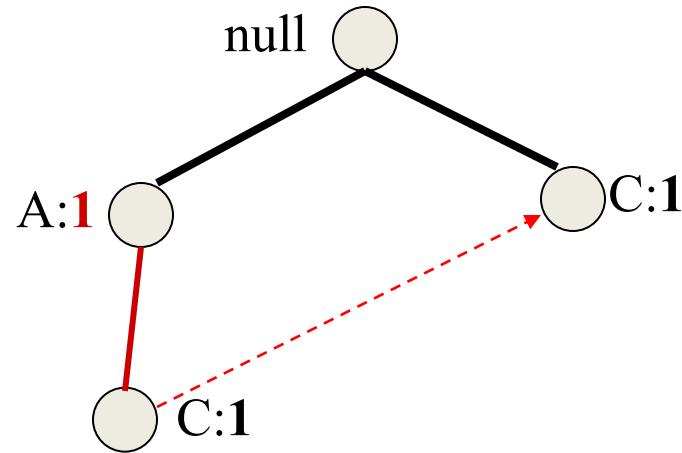

Phase 2

Construct the conditional FP-tree

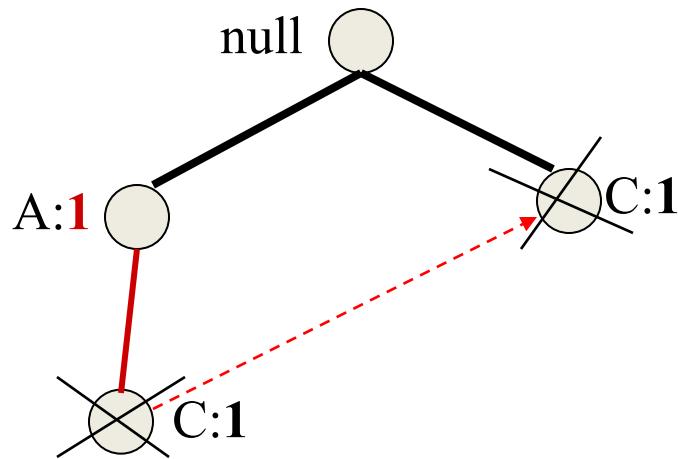

1. Recompute Support
2. Prune nodes

Example

Recompute support

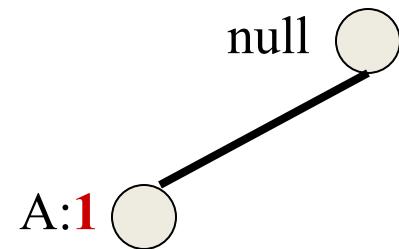

Example

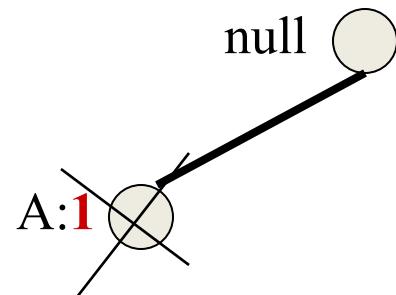

Prune nodes

Example

Prune nodes

Example

Prune nodes

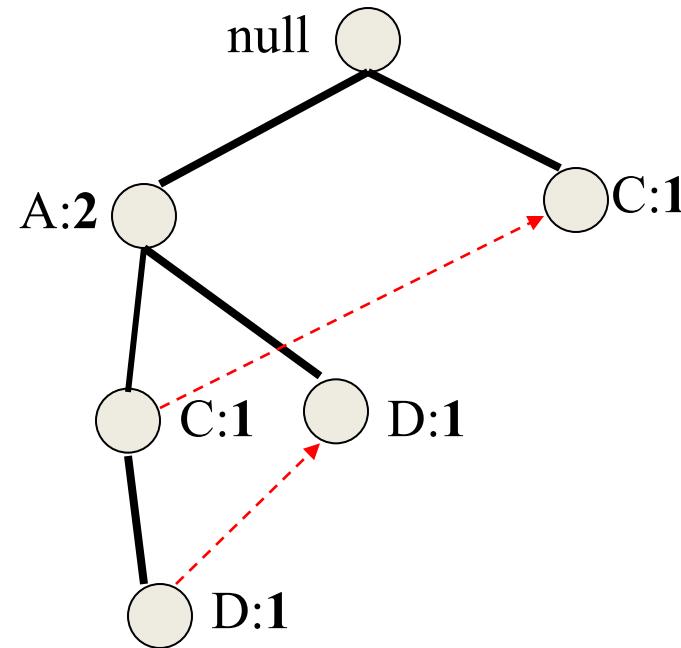

Example

null 

Prune nodes

Return to the previous subproblem

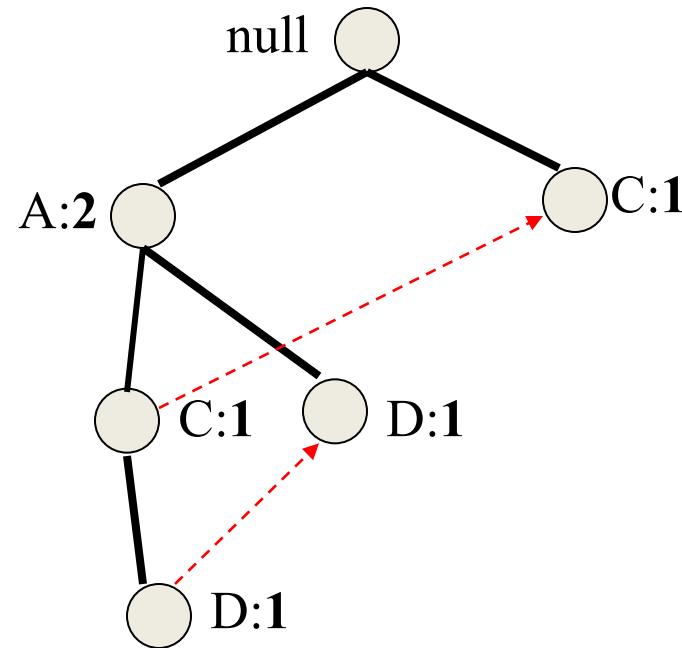

Example

The conditional FP-tree for E

We repeat the algorithm for $\{\overline{D}, E\}$, $\{\overline{C}, E\}$, $\{\overline{A}, E\}$

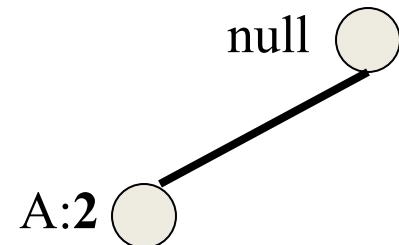

Example

Phase 1

Find all prefix paths that contain A (AE) in the conditional FP-tree

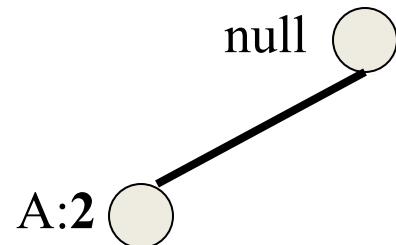

Example

Phase 1

Find all prefix paths that contain A (AE) in the conditional FP-tree

Example

Compute the support of {A,E} by following the pointers in the tree
 $2 \geq \text{minsup}$

{A,E} is frequent

There is no conditional FP-tree for {A,E}

Example

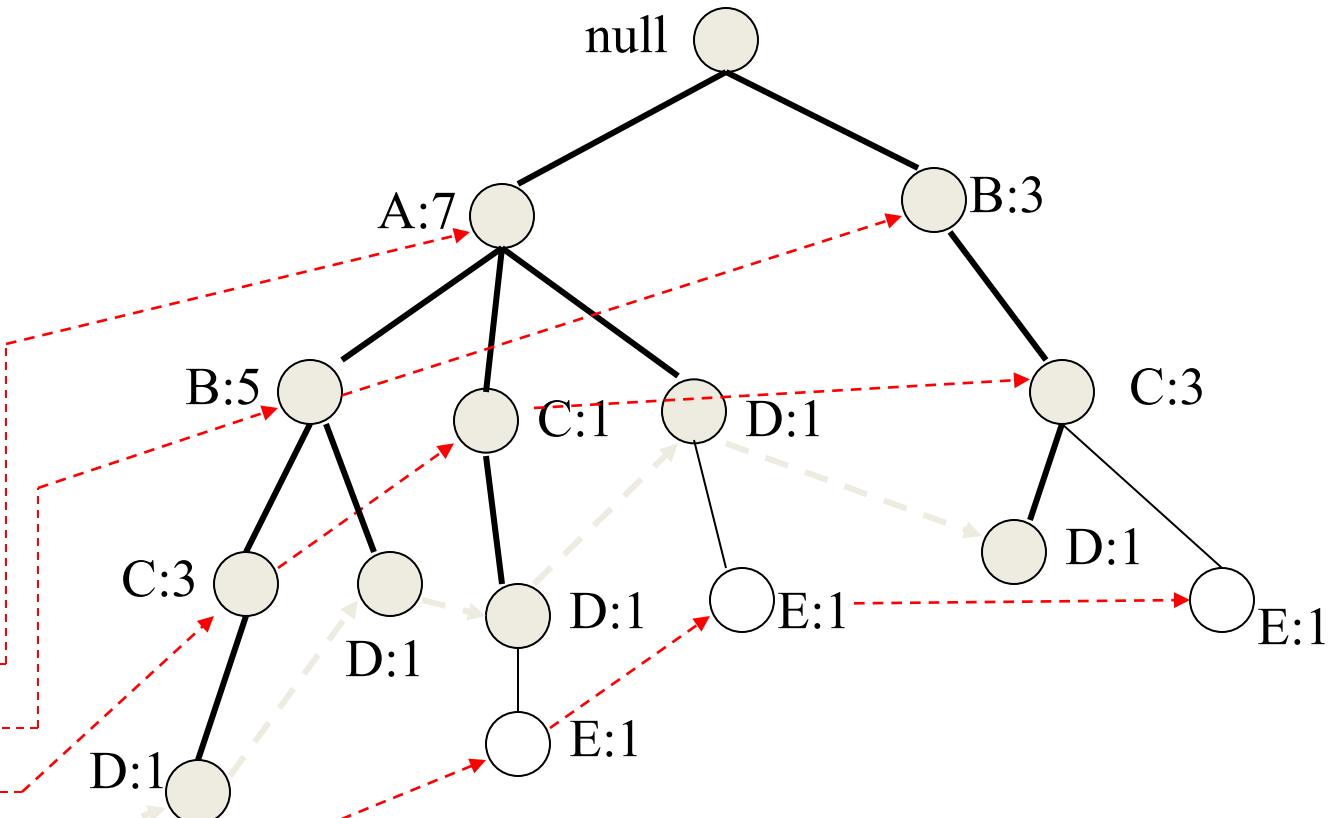

- So for E we have the following frequent itemsets
 $\{E\}$, $\{D,E\}$, $\{C,E\}$, $\{A,E\}$ $\{ADE\}$
- We proceed with D

Example

Ending in **D**

Header table

| Item | Pointer |
|------|---------|
| A | |
| B | |
| C | |
| D | ----- |
| E | |

Example

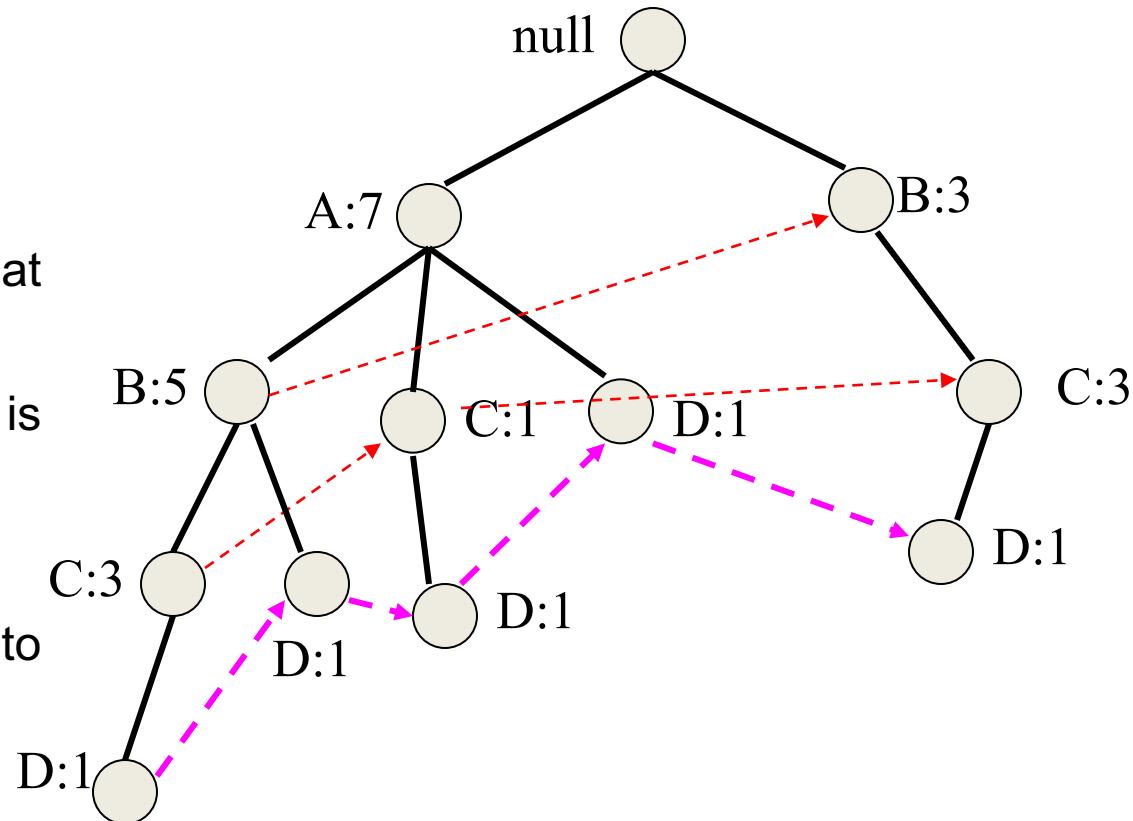

Phase 1 – construct prefix tree

Find all prefix paths that contain D

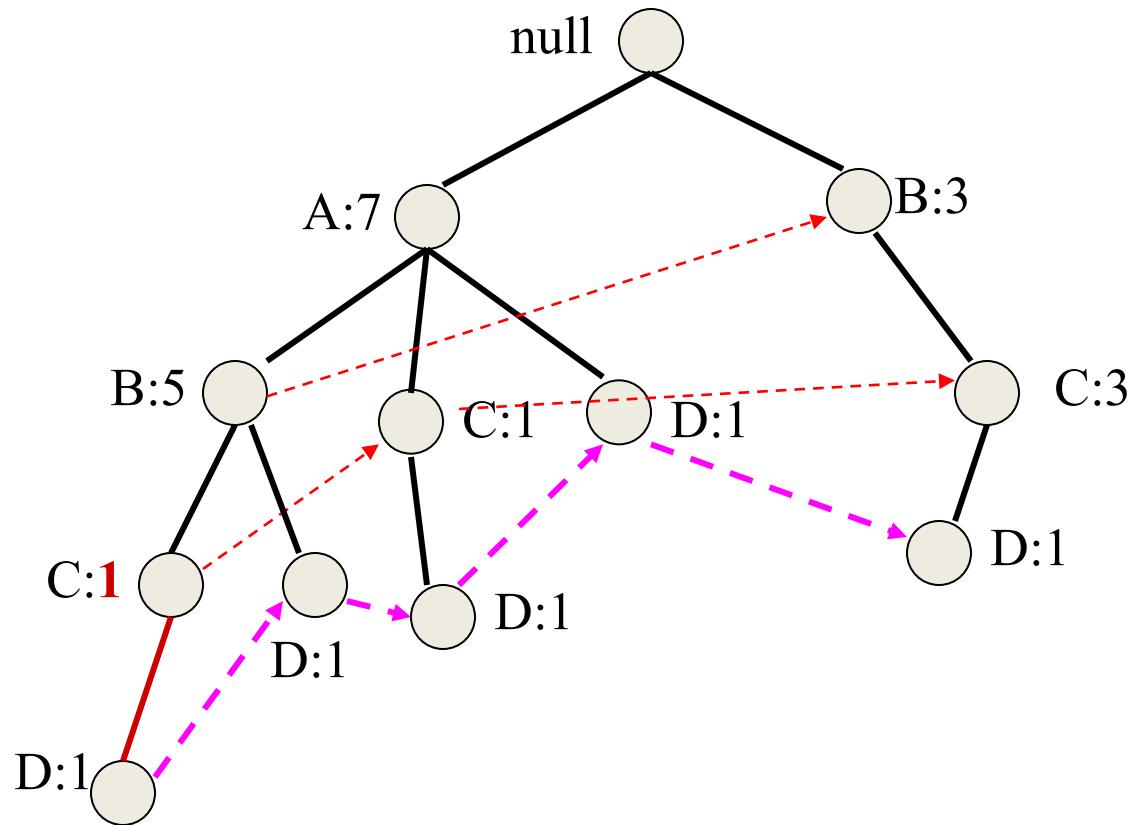

Support $5 > \text{minsup}$, D is frequent

Phase 2

Convert prefix tree into conditional FP-tree

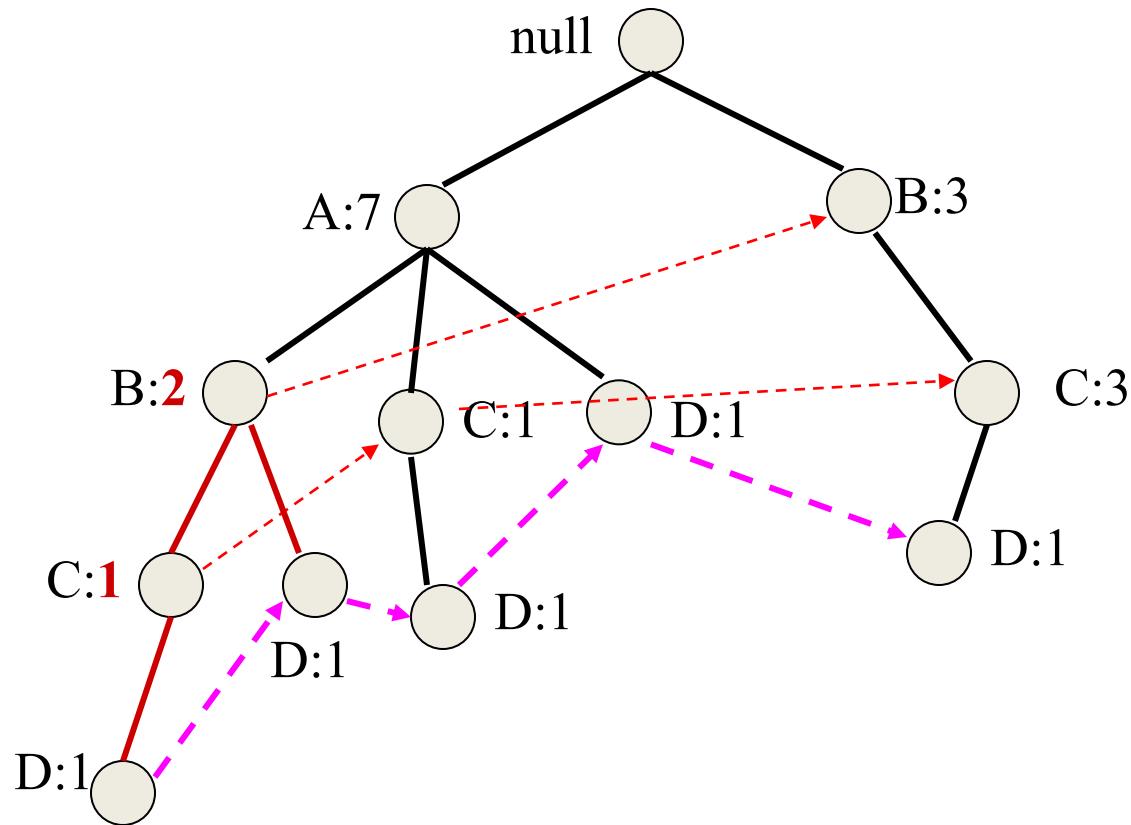

Example

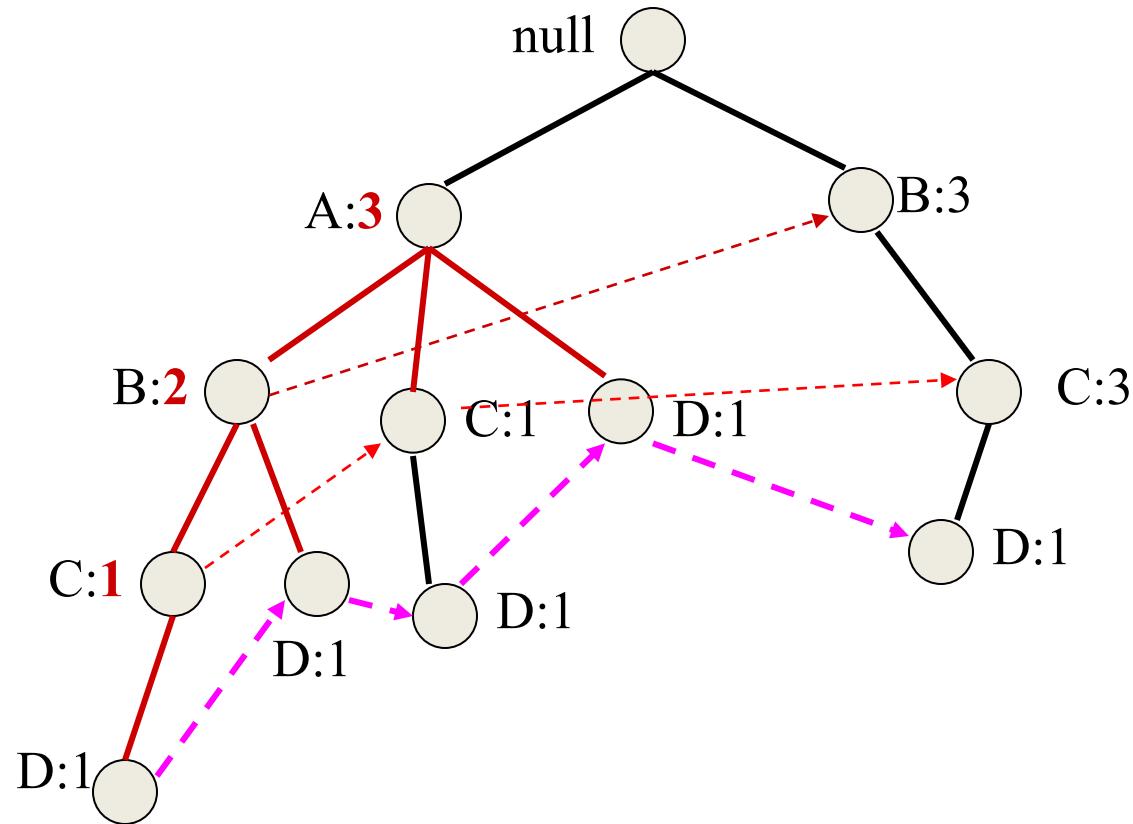

Recompute support

Example

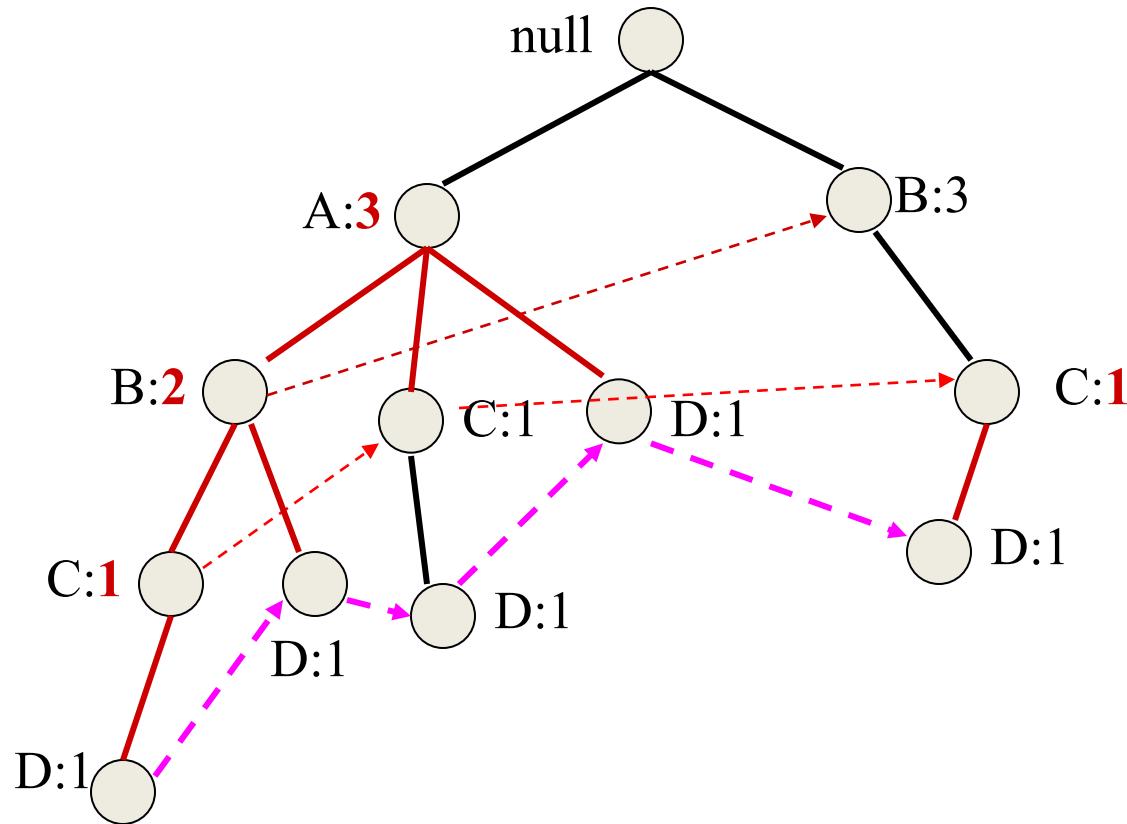

Recompute support

Example

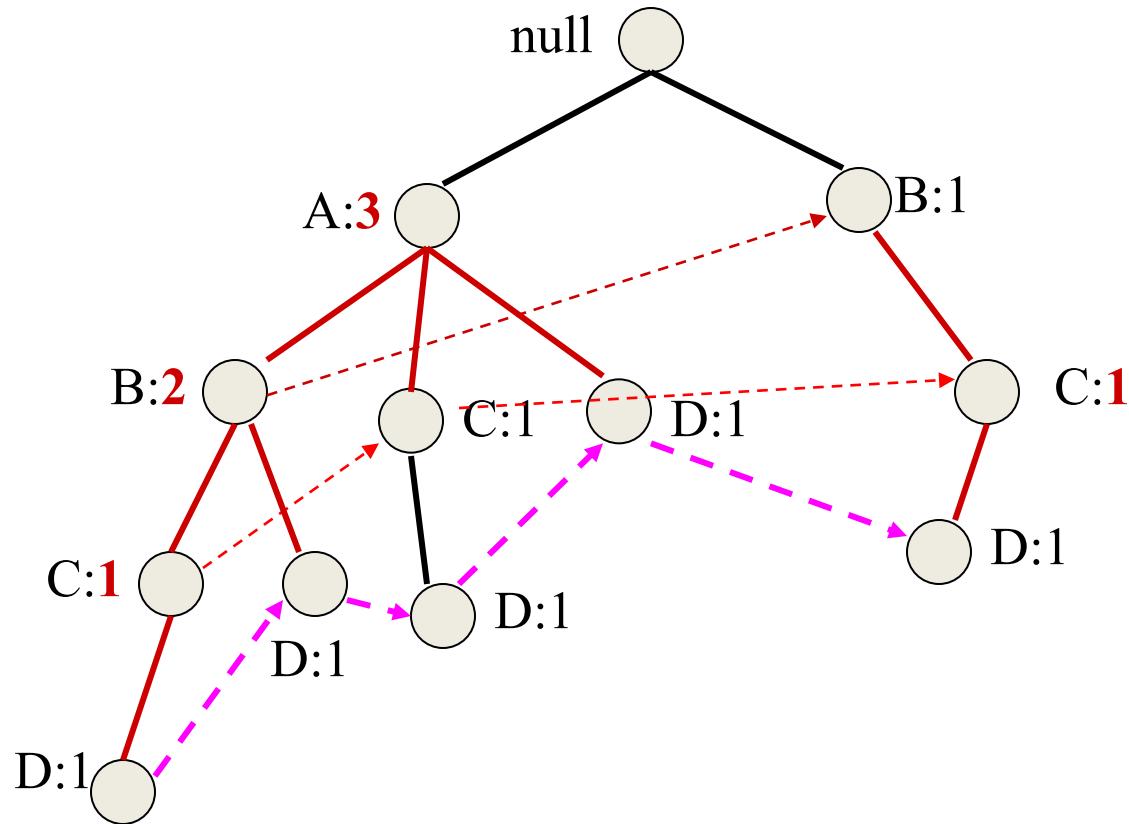

Recompute support

Example

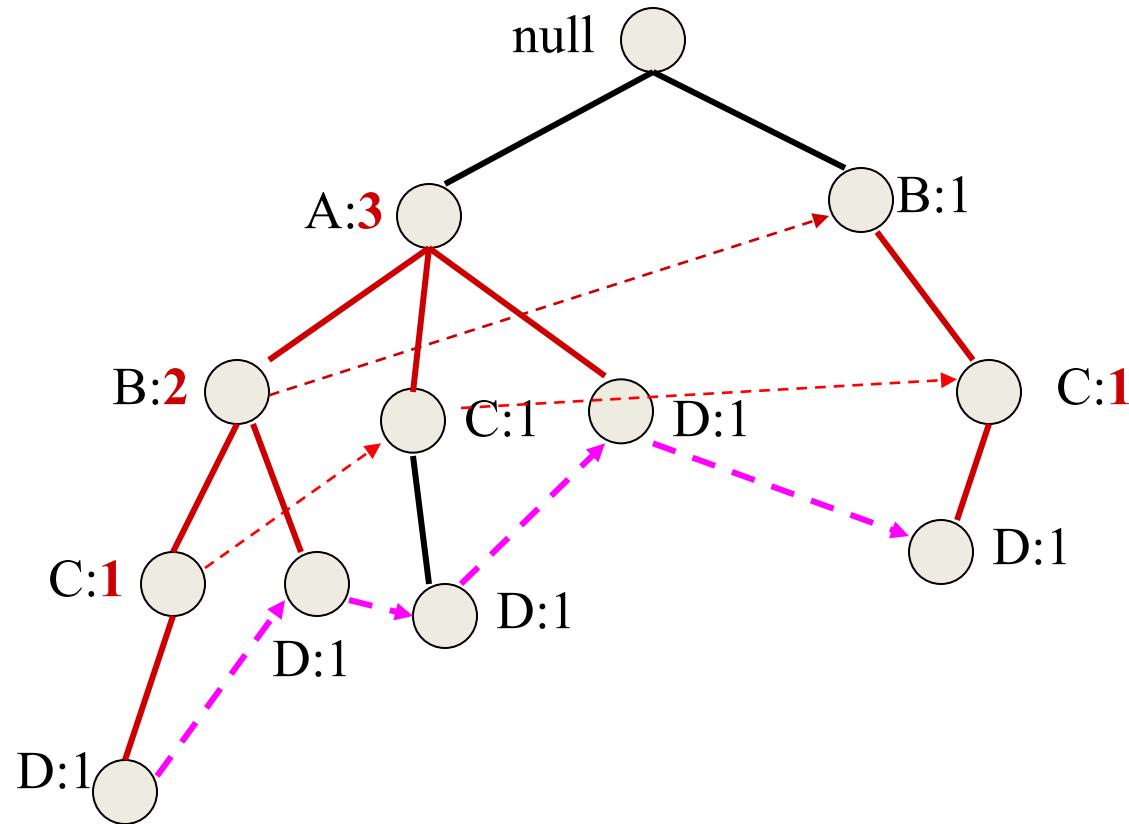

Recompute support

Example

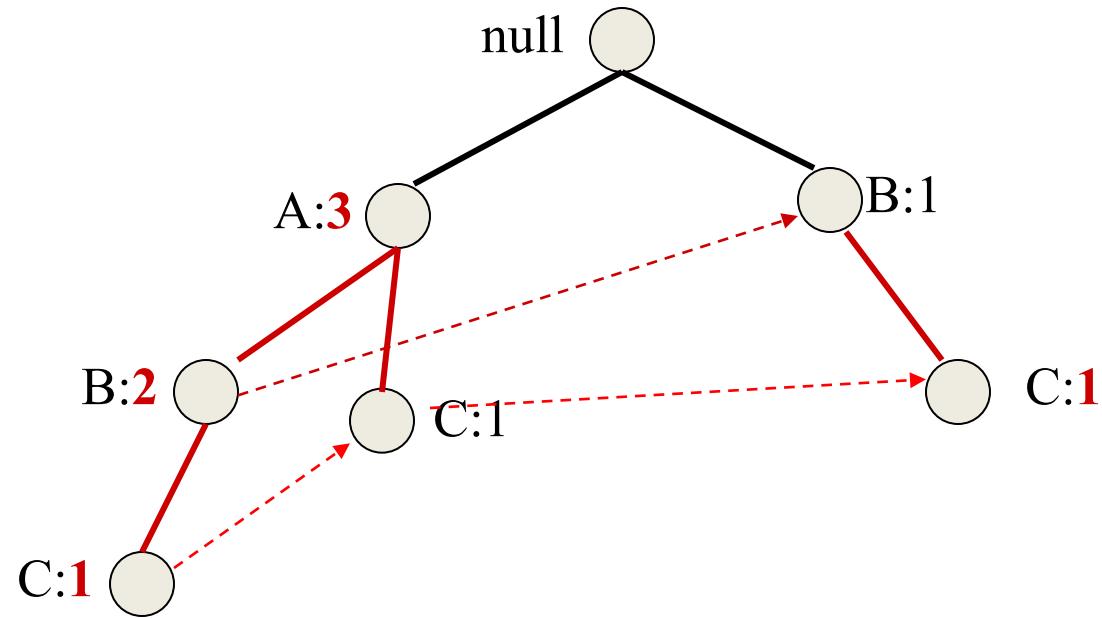

Recompute support

Example

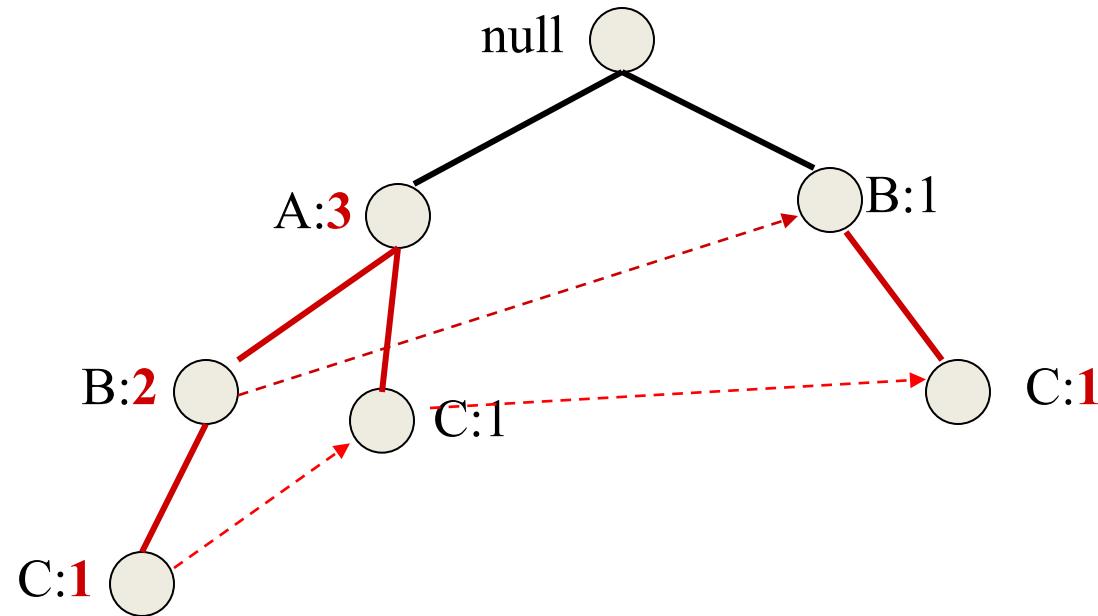

Prune nodes

Example

Prune nodes

Example

Construct conditional FP-trees for {C,D}, {B,D}, {A,D}

And so on....

Observations

- At each recursive step we solve a subproblem
 - Construct the prefix tree
 - Compute the new support
 - Prune nodes
- Subproblems are disjoint so we never consider the same itemset twice
- **Support computation is efficient** – happens together with the computation of the frequent itemsets.

Observations

- The efficiency of the algorithm depends on the **compaction factor** of the dataset
- If the tree is bushy then the algorithm does not work well, it increases a lot of number of subproblems that need to be solved.
