

# Tecniche di Progettazione: Design Patterns

GoF: Composite

# Composite pattern

---

## ▶ Intent

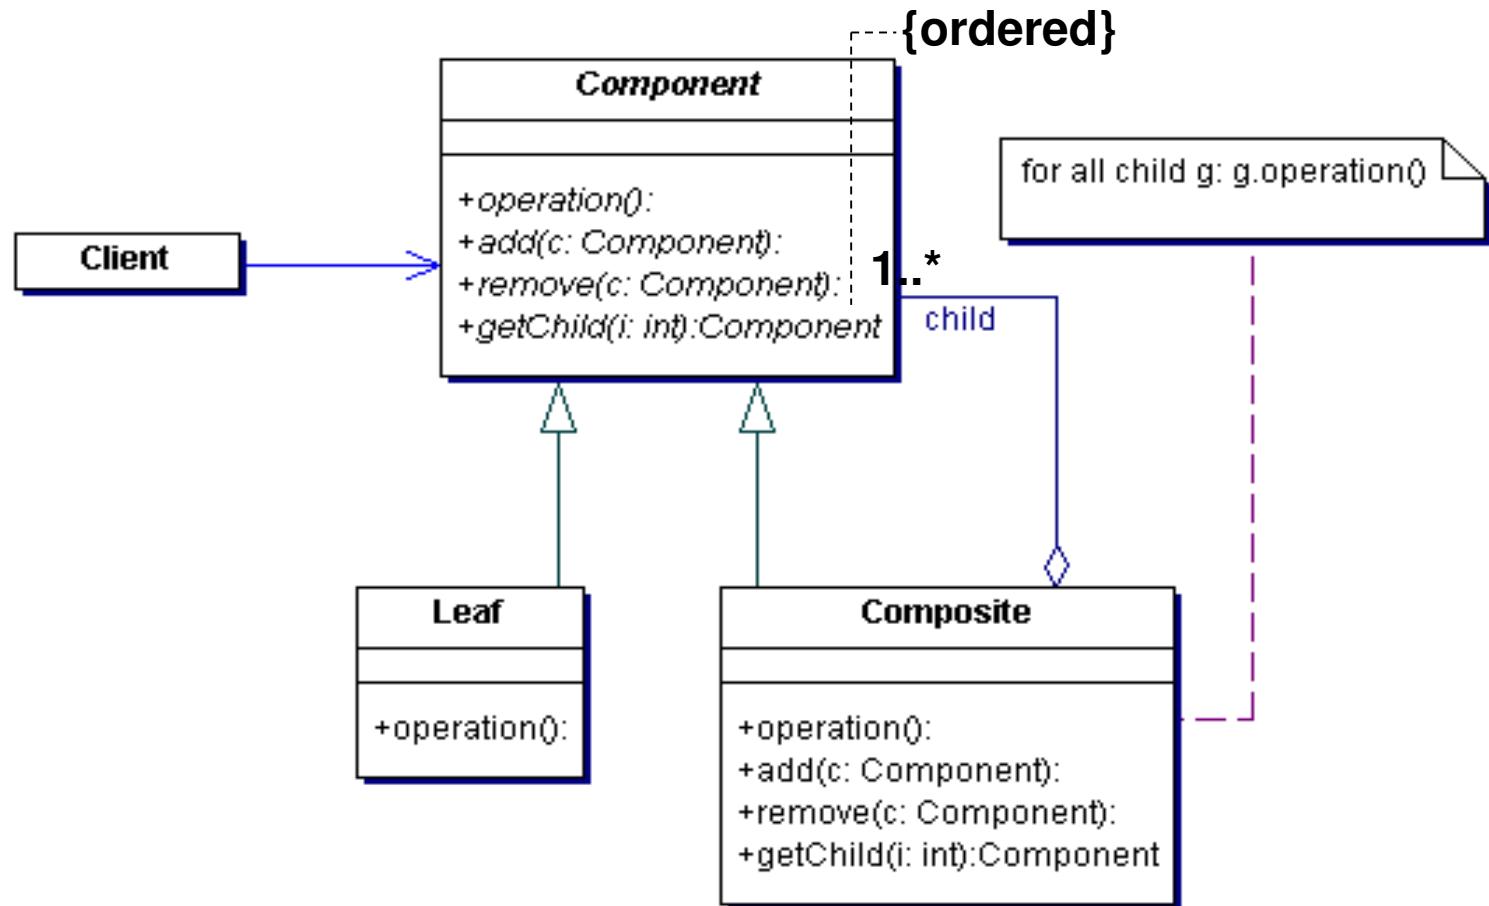

- ▶ Compose objects into tree structures to represent part-whole hierarchies. Composite lets clients treat individual objects and compositions of objects uniformly. This is called recursive composition.

## ▶ Applicability

- ▶ Use the Composite pattern when
  - ▶ You want to represent part-whole hierarchies of objects
  - ▶ You want clients to be able to ignore the difference between compositions of objects and individual objects.

# Composite: structure

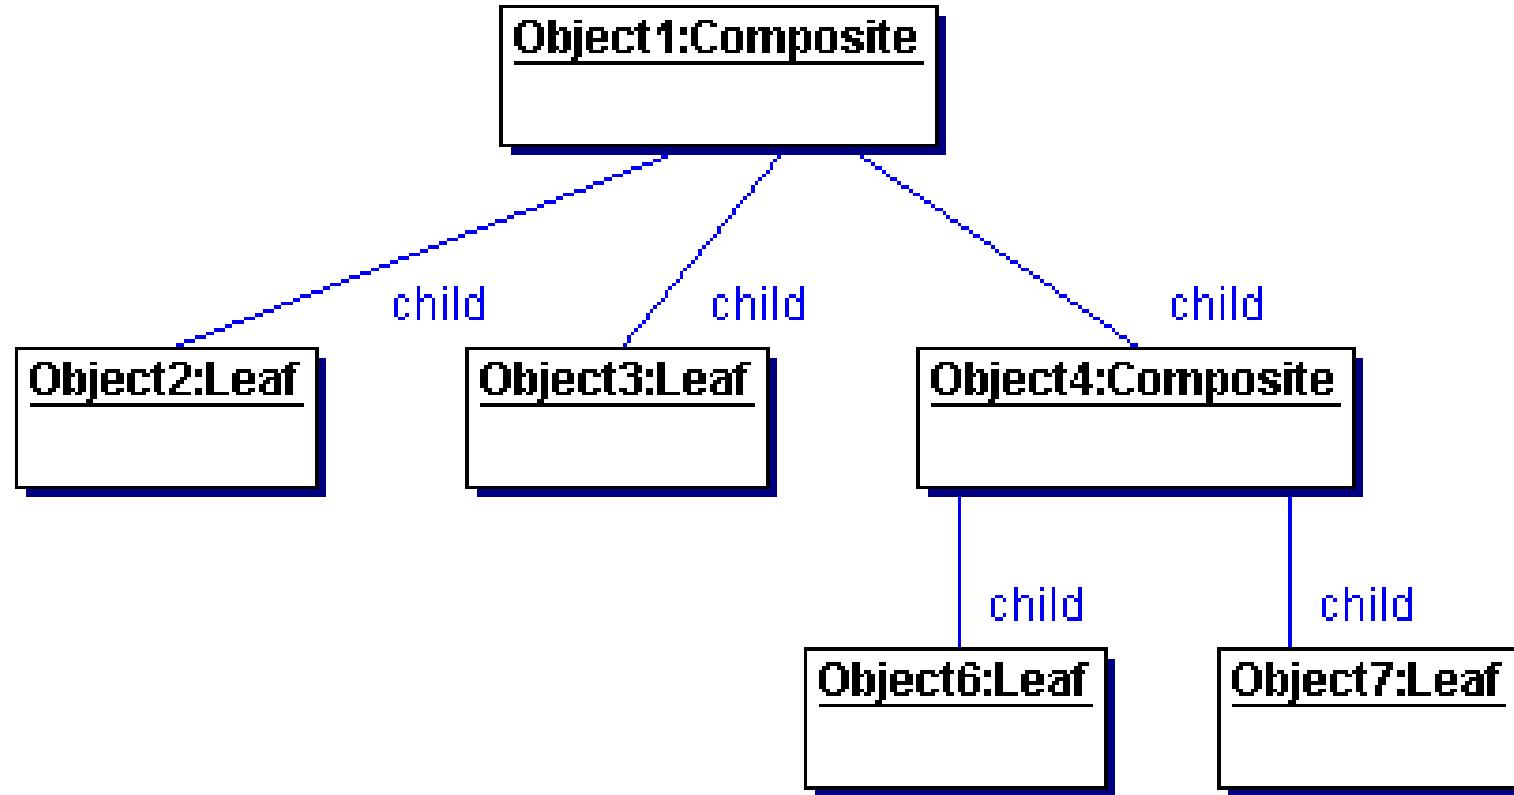

# Composite: participants

---

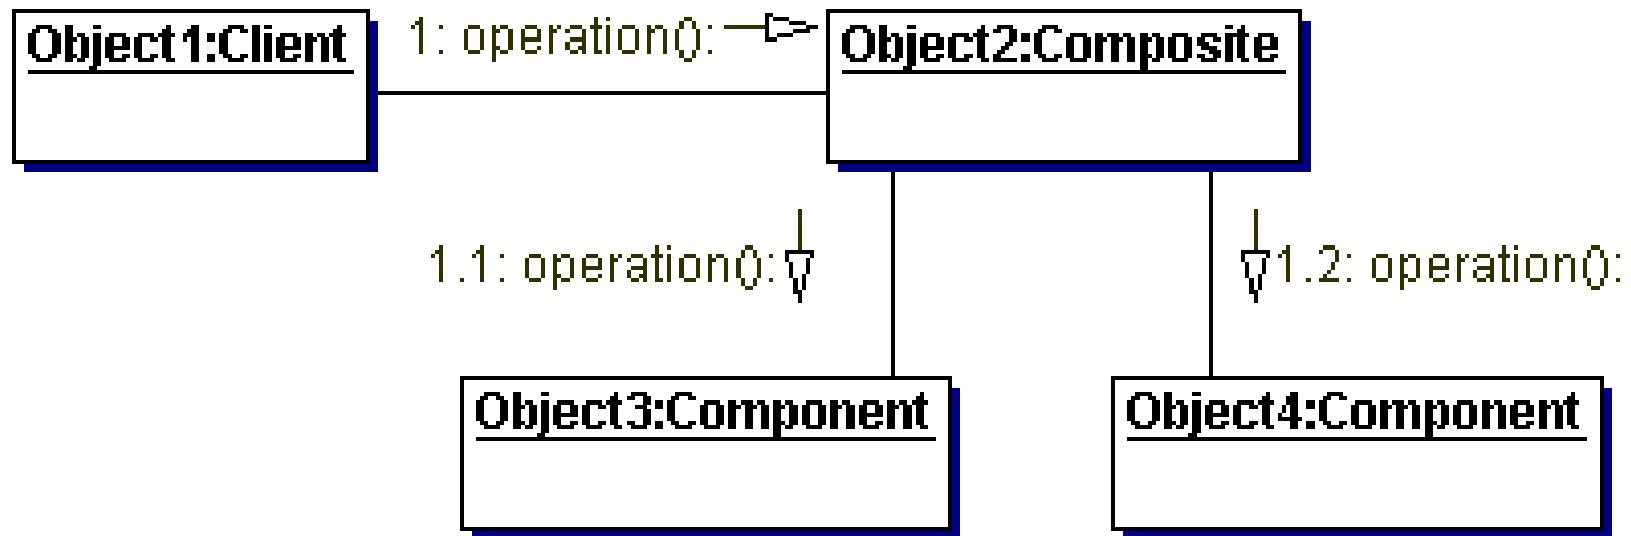

- ▶ **Component**
  - ▶ declares the interface for object composition
  - ▶ implements default behaviour (if any)
  - ▶ declares an interface for accessing and managing the child components
- ▶ **Leaf**
  - ▶ Defines the behaviour of the composition primitive objects
- ▶ **Composite:**
  - ▶ defines behaviour for components having children
  - ▶ stores child components
  - ▶ implements operations to access childs
- ▶ **Client:**
  - ▶ manipulates objects in the composition through the Composite interface

# Composite: Example

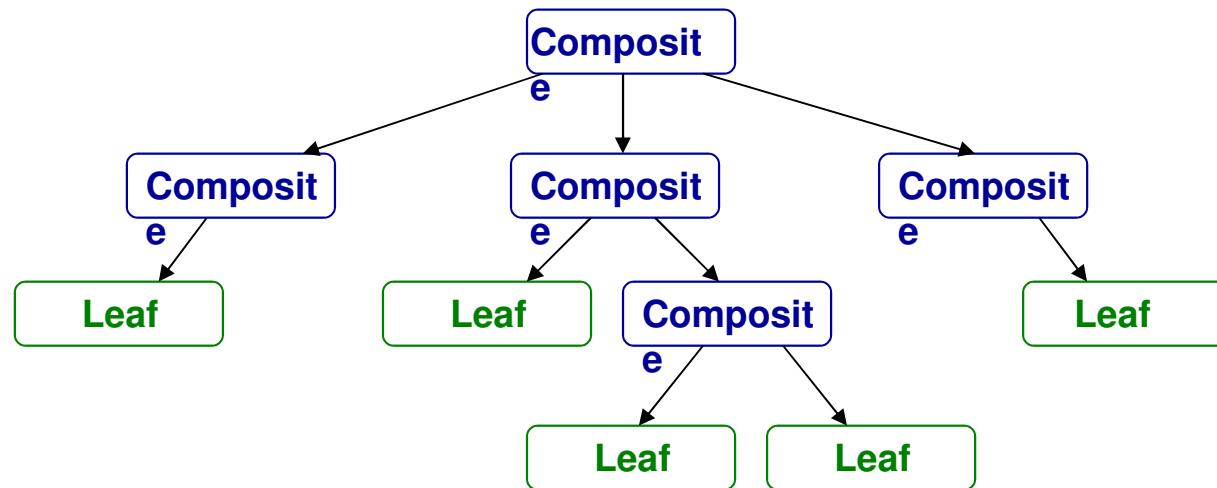

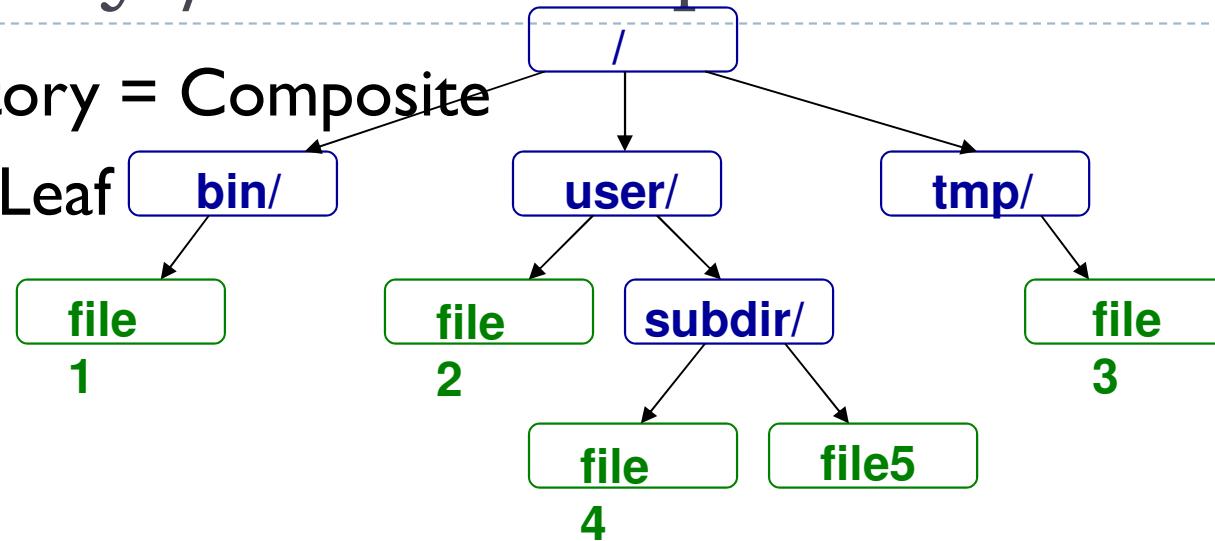

# Composite: Collaboration

# Directory / File Example

- ▶ Directory = Composite

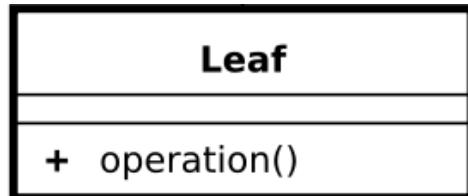

- ▶ File = Leaf

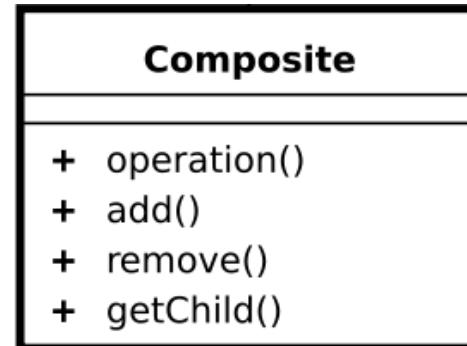

# Directory / File Example – Classes

- ▶ One class for Files (Leaf nodes)
- ▶ One class for Directories (Composite nodes)
  - ▶ Collection of Directories and Files
- ▶ How do we make sure that Leaf nodes and Composite nodes can be handled uniformly?
  - ▶ Derive them from the same abstract base class

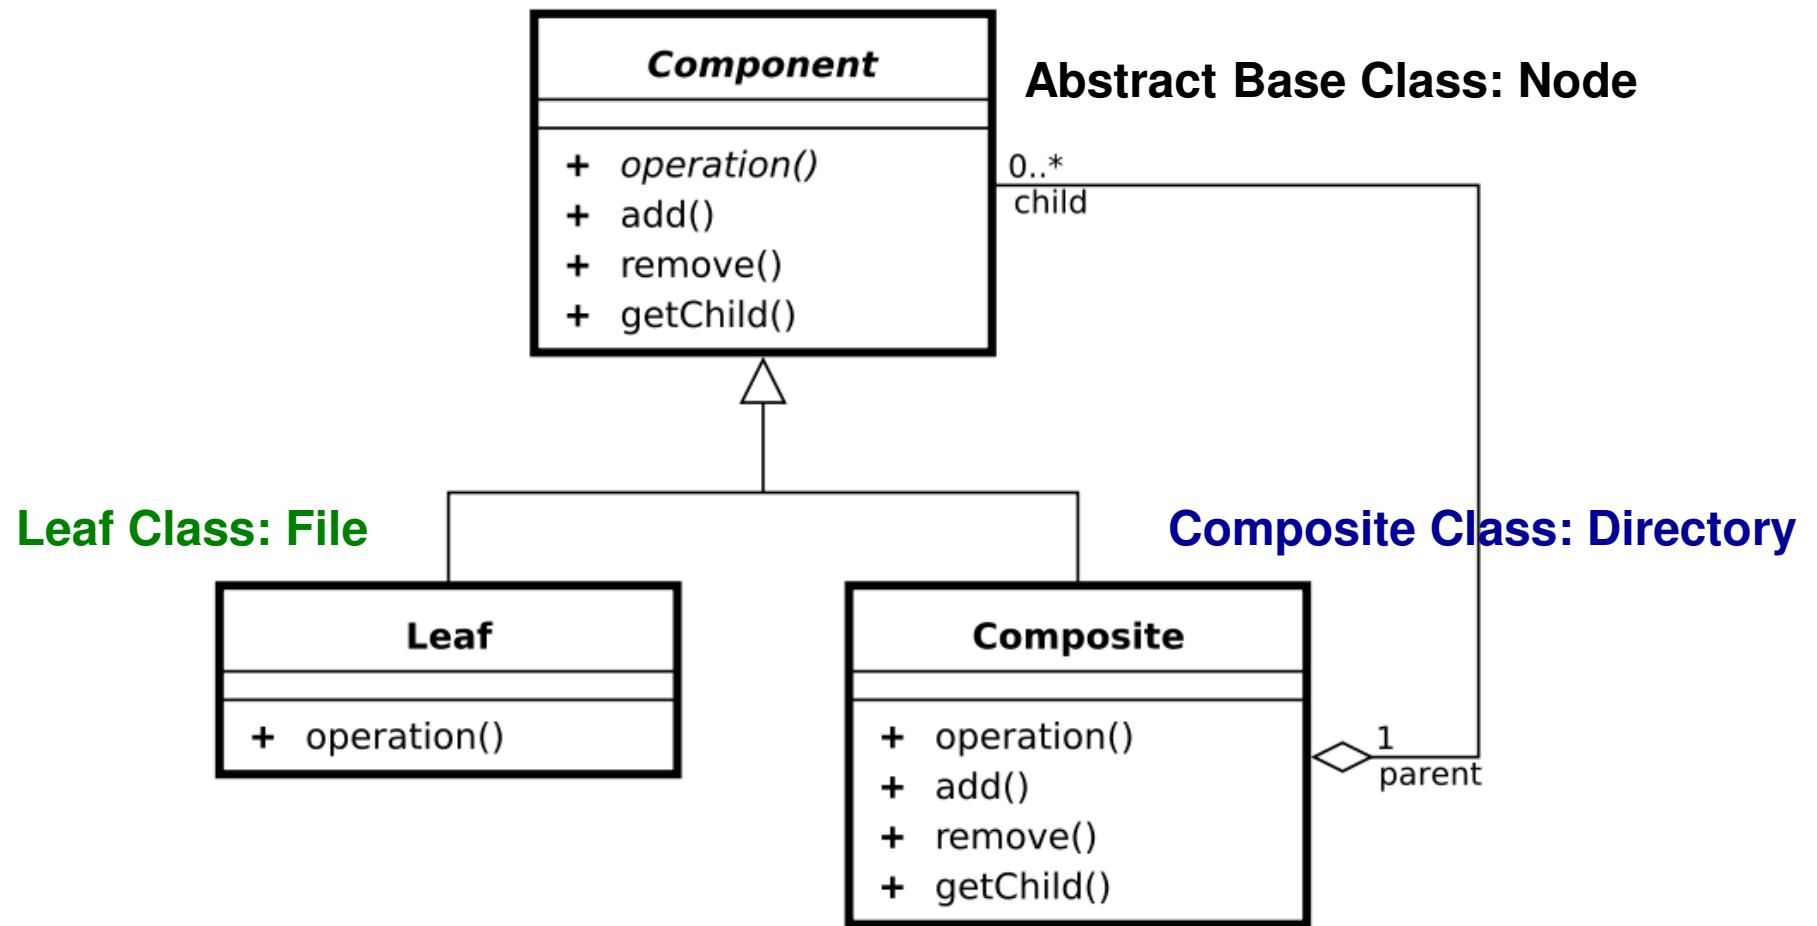

**Leaf  
Class:  
File**

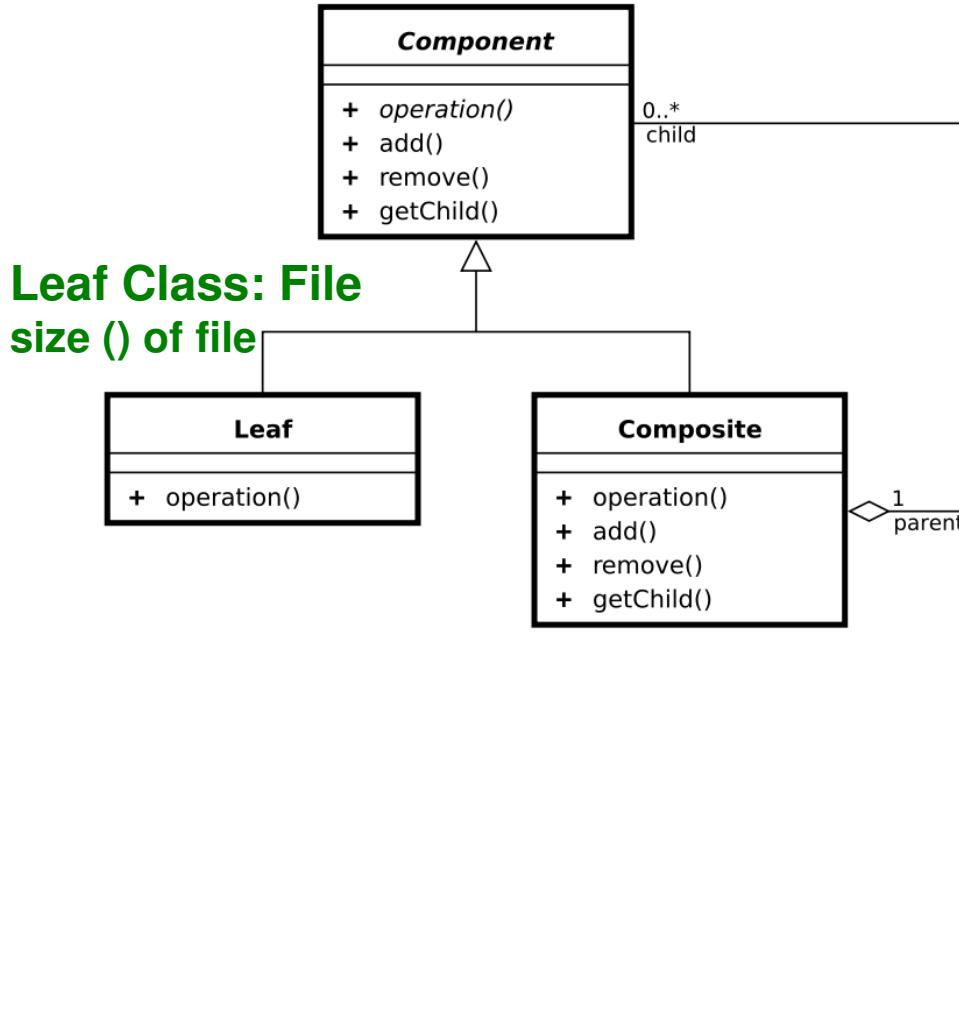

**Composite Class:  
Directory**

# Directory / File Example – Structure

# Directory / File Example – Operation

**Leaf Class: File**  
size () of file

**Abstract Base Class: Node**  
size() in bytes of entire directory  
and sub-directories

**Composite Class: Directory**  
size () Sum of file sizes in this  
directory and its sub-  
directories

```
long Directory::size () {
    long total = 0;
    Node* child;
    for (int i = 0; child = getChild(); ++i) {
        total += child->size();
    }
    return total;
}
```

# Consequences

---

- ▶ Solves problem of how to code recursive hierarchical part-whole relationships.
- ▶ Client code is simplified.
  - ▶ Client code can treat primitive objects and composite objects uniformly.
  - ▶ Existing client code does not need changes if a new leaf or composite class is added (because client code deals with the abstract base class).
- ▶ Can make design overly general.
  - ▶ Can't rely on type system to restrict the components of a composite. Need to use run-time checks.

# Implementation Issues

---

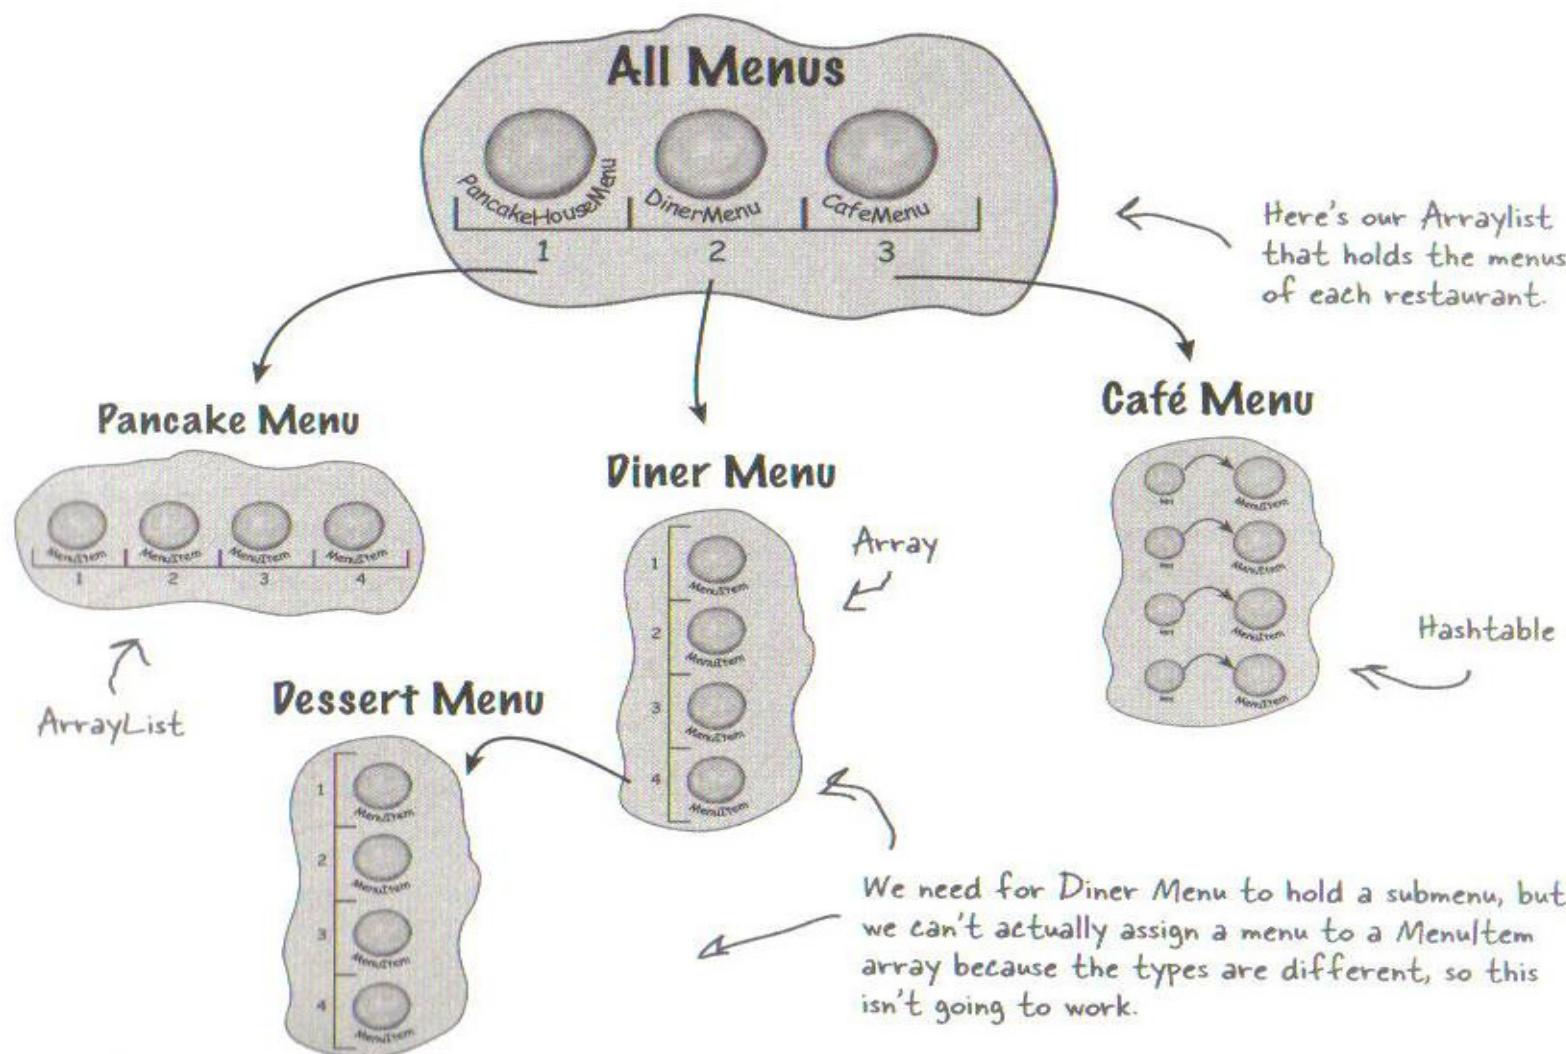

- ▶ Should Component maintain the list of components that will be used by a composite object? That is, should this list be an instance variable of Component rather than Composite?
  - ▶ Better to keep this part of Composite and avoid wasting the space in every leaf object.
- ▶ Where should the child management methods (add(), remove(), getChild()) be declared?
  - ▶ In the Component class: Gives transparency, since all components can be treated the same. But it's not safe, since clients can try to do meaningless things to leaf components at run-time.
  - ▶ In the Composite class: Gives safety, since any attempt to perform a child operation on a leaf component will be caught at compile-time. But we lose transparency, since now leaf and composite components have different interfaces.

# Implementation Issues cont'd

---

- ▶ Is child ordering important?
  - ▶ Depends on application
- ▶ What's the best data structure to store components?
  - ▶ Depends on application
- ▶ A composite object knows its contained components, that is, its children. Should components maintain a reference to their parent component?
  - ▶ Depends on application, but having these references supports the Chain of Responsibility pattern

What we want (something like this):

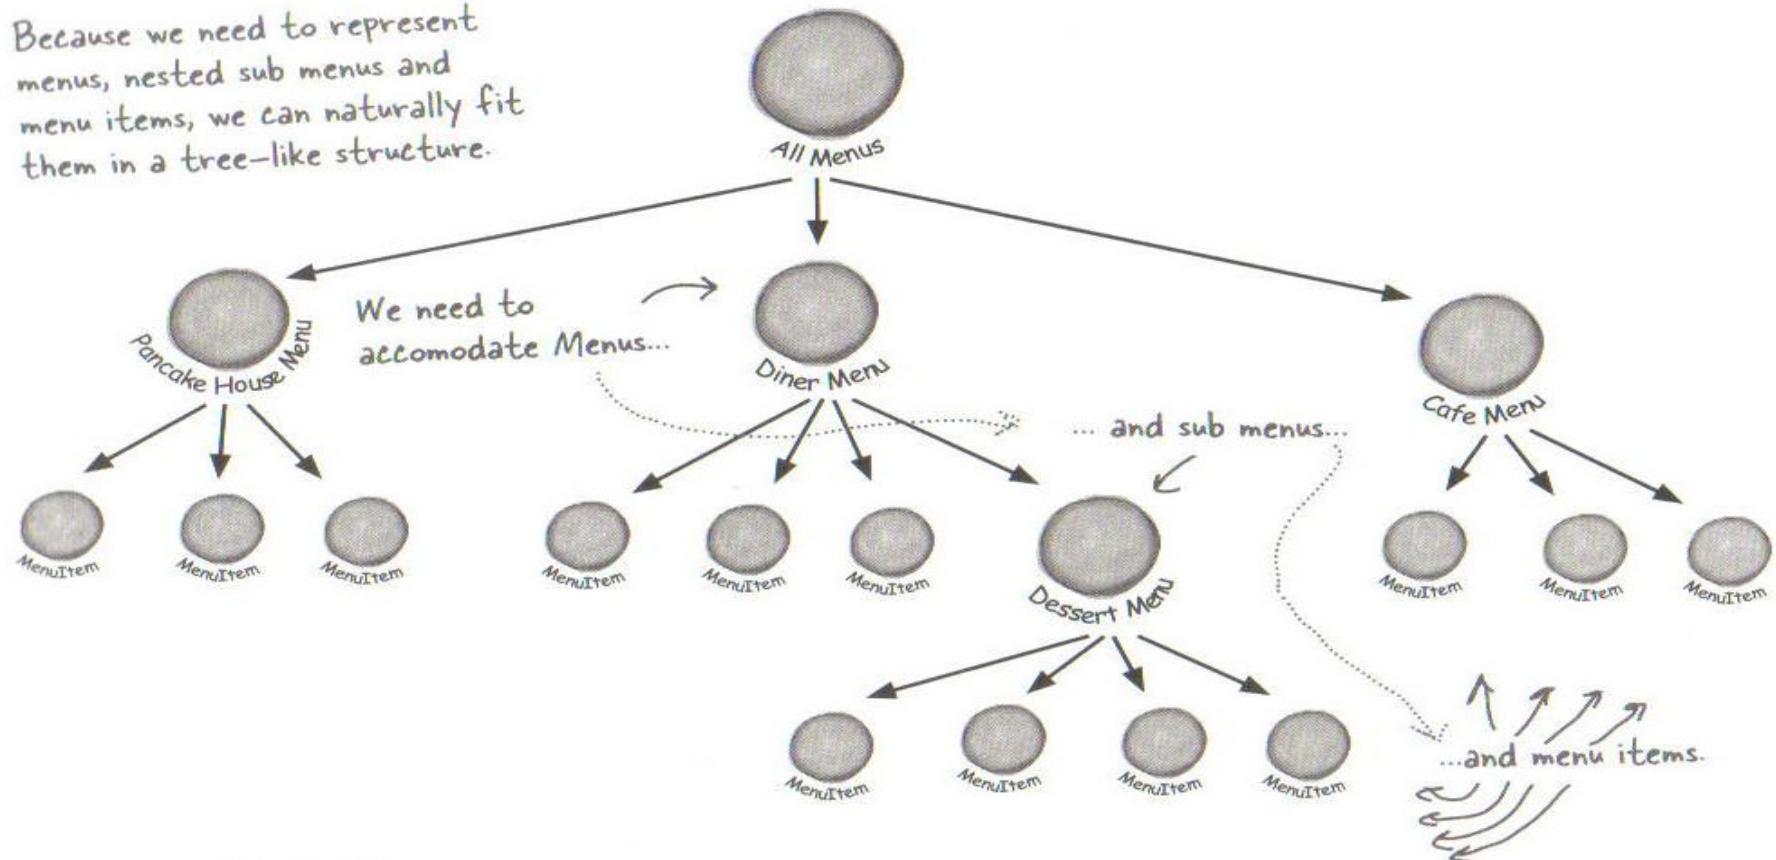

But this  
won't work!

We can't assign a dessert menu to  
a MenuItem array.

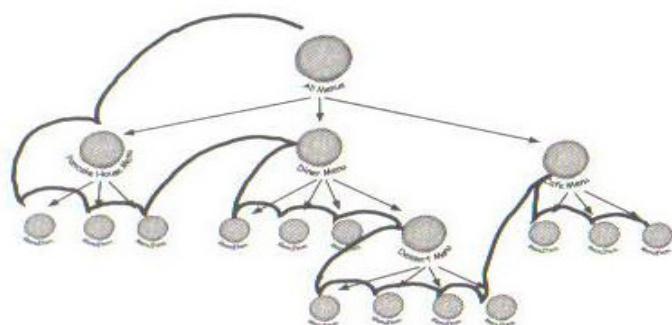

Time for a change!

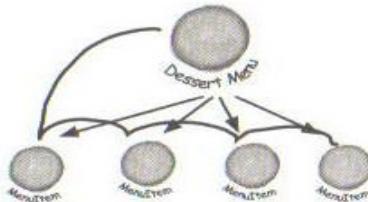

Because we need to represent menus, nested sub menus and menu items, we can naturally fit them in a tree-like structure.

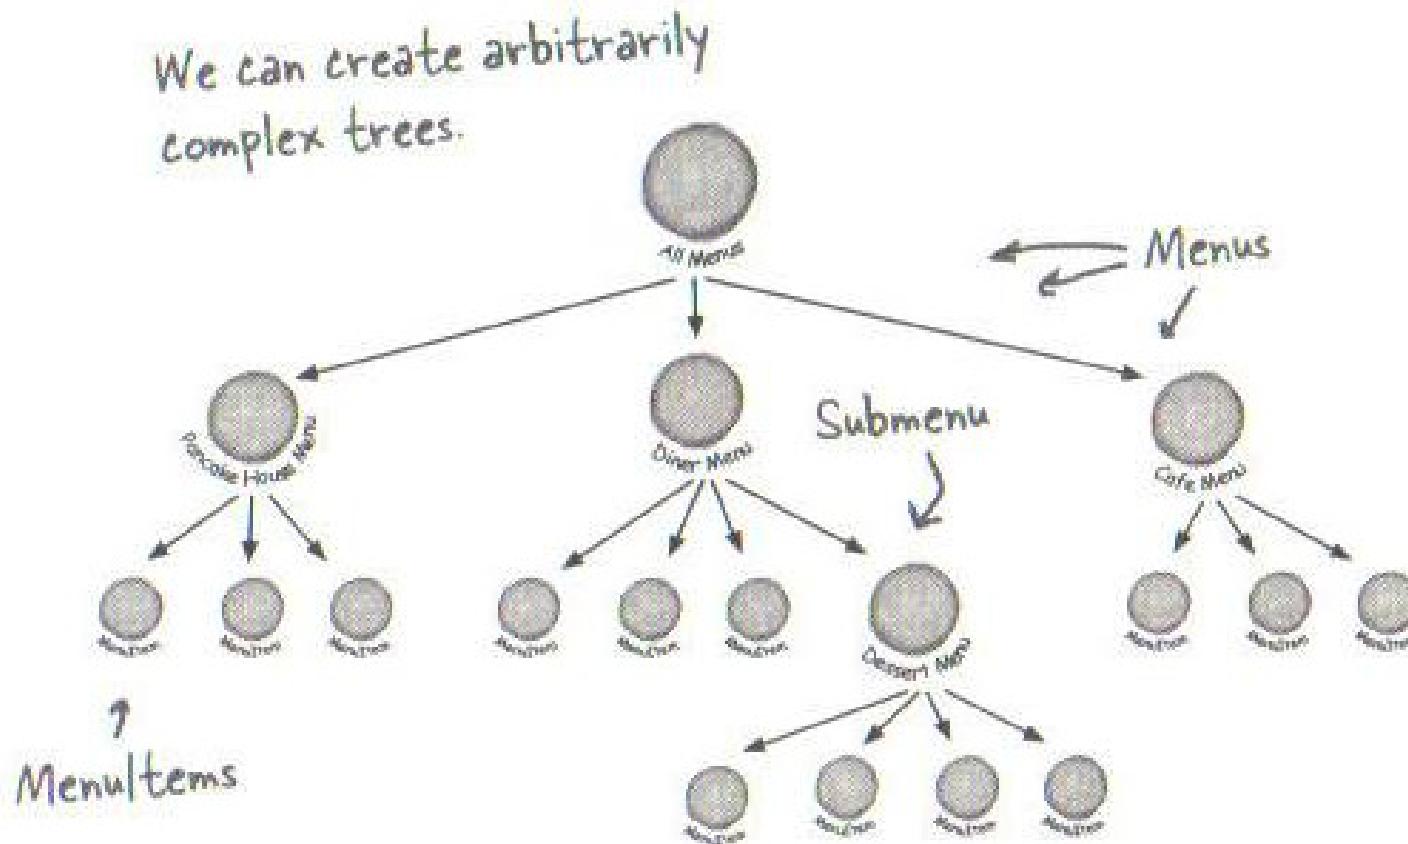

We still need to be able to traverse the all the items in the tree.

We also need to be able to traverse more flexibly, for instance over one menu.

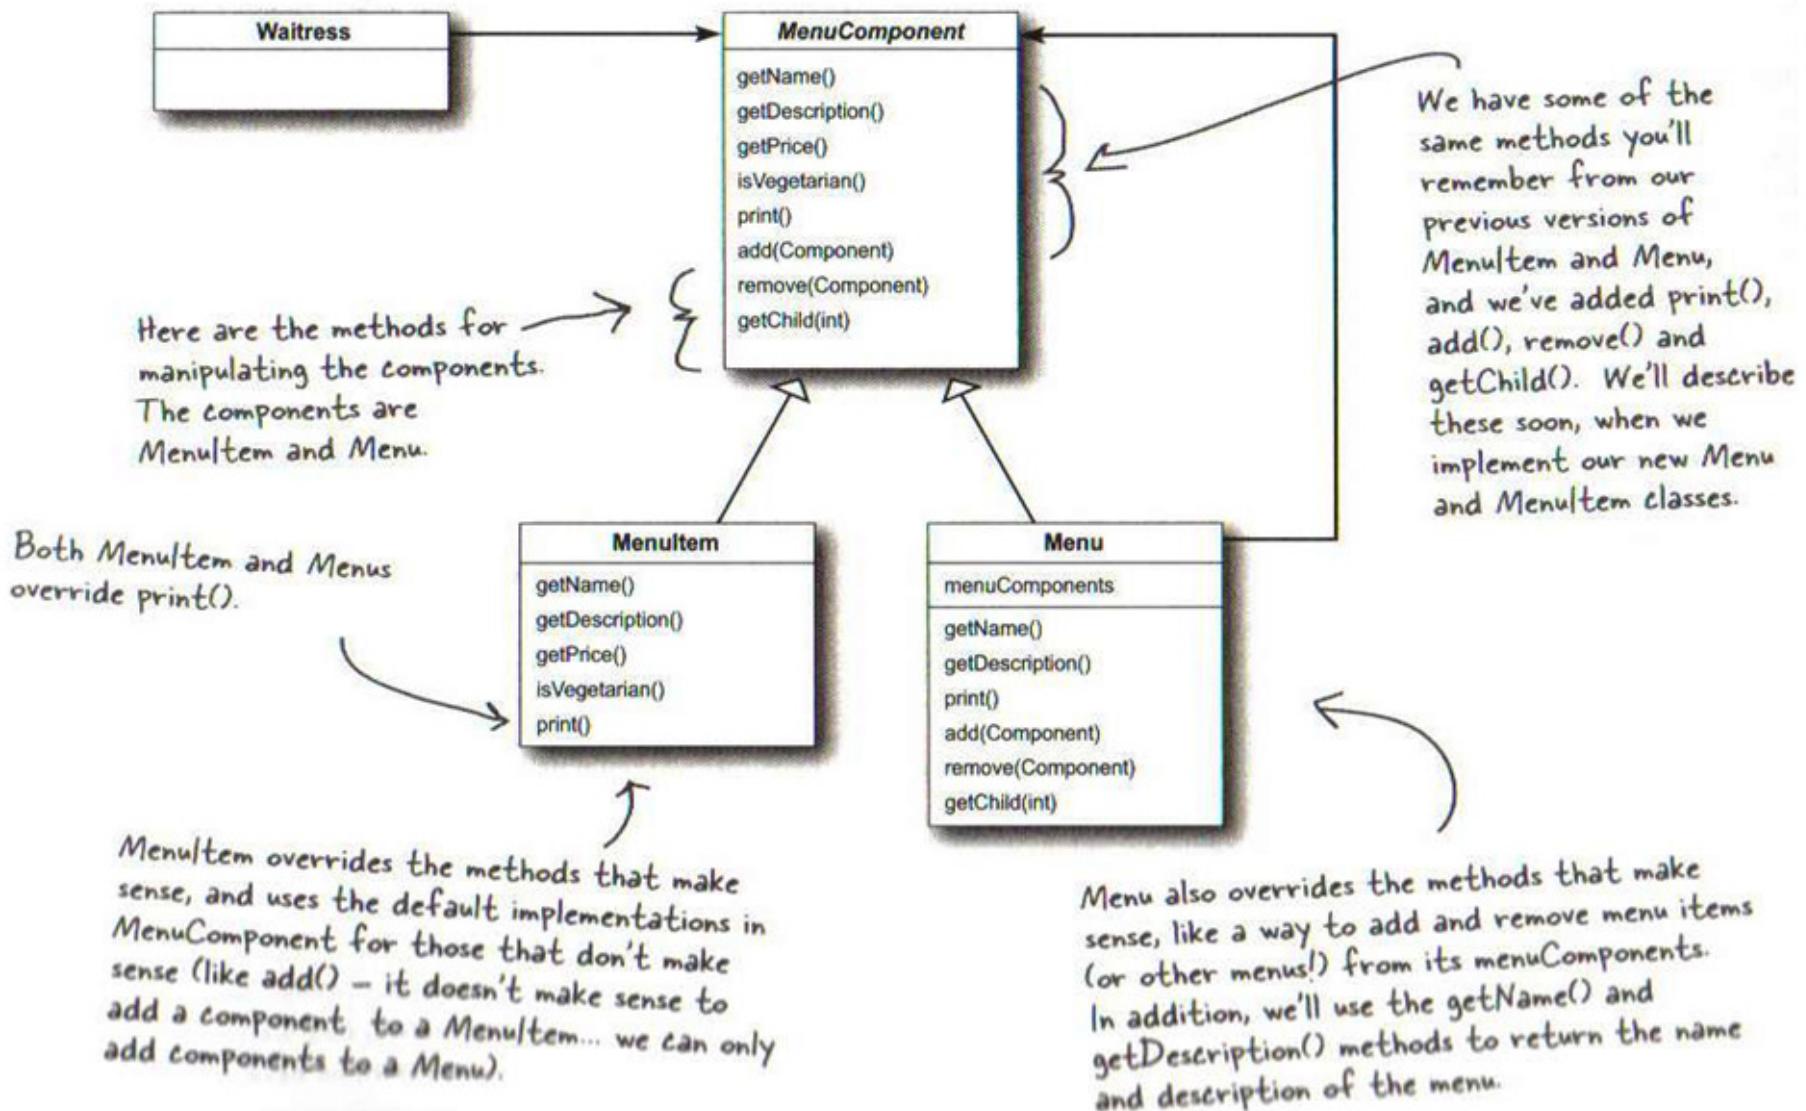

# Complex hierarchy of menu items

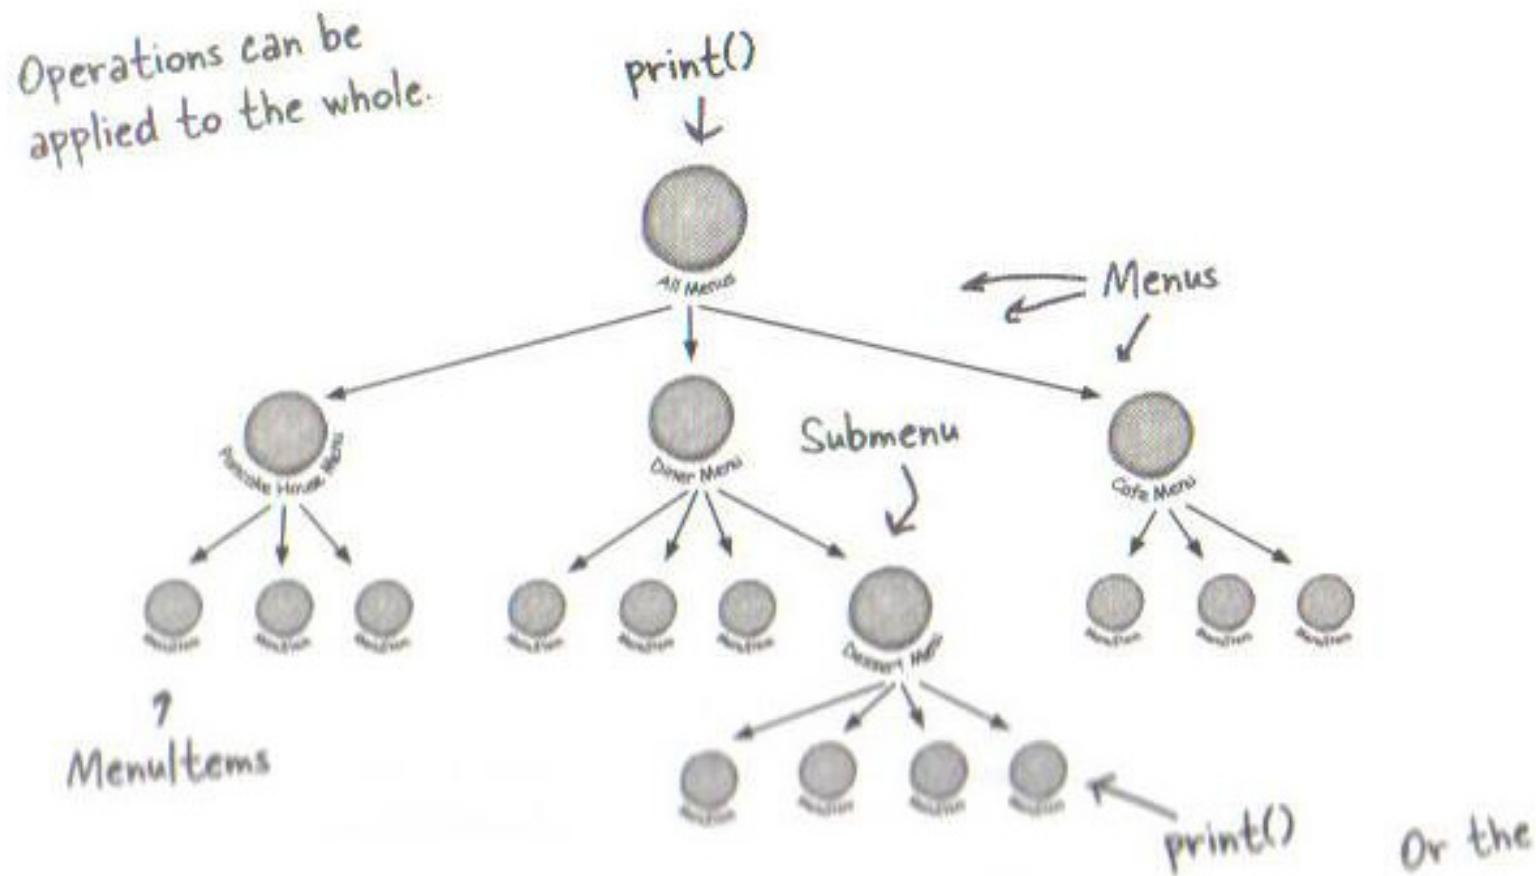

The Waitress is going to use the MenuComponent interface to access both Menus and MenuItem.

MenuComponent represents the interface for both MenuItem and Menu. We've used an abstract class here because we want to provide default implementations for these methods.

# Operations applied to whole or parts

# menuHFcodeInternalIterator

---

- ▶ code in the following slides
- ▶ Requirement: print the menus

# MenuComponent

---

```
public abstract class MenuComponent {  
    public void add(MenuComponent menuComponent) {  
        throw new UnsupportedOperationException();  
    }  
    public void remove(MenuComponent menuComponent) {  
        throw new UnsupportedOperationException();  
    }  
    public MenuComponent getChild(int i) {  
        The composite methods  
        throw new UnsupportedOperationException();  
    }  
    public String getName() {  
        throw new UnsupportedOperationException();  
    }  
}
```

# MenuComponent

---

...

```
public String getDescription() {  
    throw new UnsupportedOperationException();  
}  
  
public double getPrice() {  
    throw new UnsupportedOperationException();  
}  
  
public boolean isVegetarian() {  
    throw new UnsupportedOperationException();  
}  
  
public void print() {  
    throw new UnsupportedOperationException();  
}  
}
```

# MenuItem

---

```
public class MenuItem extends MenuComponent {  
    String name;  
    String description;  
    boolean vegetarian;  
    double price;  
    public MenuItem(String name, String description, boolean vegetarian, double price){  
        this.name = name;  
        this.description = description;  
        this.vegetarian = vegetarian;  
        this.price = price;  
    }  
    ...
```

# MenuItem

---

...

```
public String getName() { return name; }
public String getDescription() { return description; }
public double getPrice() { return price; }
public boolean isVegetarian() { return vegetarian; }
public void print(){
    System.out.print(" " + getName());
    if (isVegetarian()) System.out.print("(v)");
    System.out.println(", " + getPrice());
    System.out.println(" -- " + getDescription());
}
}
```

# Menu

---

```
public class Menu extends MenuComponent {  
    ArrayList menuComponents = new ArrayList();  
    String name;  
    String description;  
    public Menu(String name, String description) {  
        this.name = name;  
        this.description = description;  
    }  
    public void add(MenuComponent menuComponent) {  
        menuComponents.add(menuComponent);  
    }  
    ...
```

# Menu

---

```
public void remove(MenuComponent menuComponent) {  
    menuComponents.remove(menuComponent);  
}  
  
public MenuComponent getChild(int i) {  
    return (MenuComponent)menuComponents.get(i);}  
  
public String getName() { return name;}  
  
public String getDescription() { return description;}  
  
public void print() {  
    System.out.print("\n" + getName());  
    System.out.println(", " + getDescription());  
    Iterator iterator = menuComponents.iterator();  
    while (iterator.hasNext()) {  
        MenuComponent menuComponent = (MenuComponent)iterator.next();  
        menuComponent.print();  
    }  
}
```

# menuHFcodeInternalIterator

---

- ▶ Some observations
  - ▶ The “print menu” method in the MenuComponent class is recursive.
  - ▶ Implementation of print() uses an iterator
- ▶ Now lets look at an alternative implementation which uses an iterator to iterate through composite classes
  - ➔ the composite iterator
  - ▶ The waitress can build the iterator she wants
    - ▶ E.g. to print only vegetarian items.
    - ▶ With the former solution there was the need to modify the code of the composite per each new printing requirement

```
public class Menu extends MenuComponent {  
    ArrayList menuComponents = new ArrayList();  
    ...  
    public Iterator createIterator() {  
        return new CompositIterator(menuComponents.iterator());  
    }  
    public void print() {  
        System.out.print("\n" + getName());  
        System.out.println(", " + getDescription());  
        System.out.println("-----");  
        Iterator iterator = menuComponents.iterator();  
        while (iterator.hasNext()) {  
            MenuComponent menuComponent =  
                (MenuComponent) iterator.next();  
            menuComponent.print();  
        }  
    }  
}
```

# Related Patterns

---

- ▶ Chain of Responsibility – Component-Parent Link
- ▶ Decorator – When used with composite will usually have a common parent class. So decorators will need to support the component interface with operations like: Add, Remove, GetChild.
- ▶ Flyweight – Lets you share components, but they can no longer reference their parents.
- ▶ Iterator – Can be used to traverse composites.
- ▶ Visitor – Localizes operations and behavior that would otherwise be distributed across composite and leaf classes.

# Homework: composite and iterator

---

- ▶ Fix the code
- ▶ Print everything but vegetarian
- ▶ Draw some conclusions (to discuss next wendnsday)

# Visit a Composite

---

Better solution.

Homework!

- ▶ Print everything
- ▶ Print veggie
- ▶ Print non veggie
- ▶ Print cheap menu

# OLD Homework: composite and iterator

---

- ▶ Using an iterator over a composite, let print all the menus, adding indentation. E.g.

## PANCAKE HOUSE MENU

K&B's Pancake Breakfast, Pancakes with scrambled eggs, and toast

Regular Pancake Breakfast, Pancakes with fried eggs, sausage

...

## CAFE MENU

Coffee Cake, Crumbly cake topped with cinnamon and walnuts

...

## DINER MENU

Vegetarian BLT, (Fakin') Bacon with lettuce & tomato on whole wheat

...

## DESSERT MENU

Apple Pie, Apple pie with a flakey crust, topped with vanilla icecream

Cheesecake, Creamy New York cheesecake, with a chocolate graham crust
