19 - EPC analysis

Object

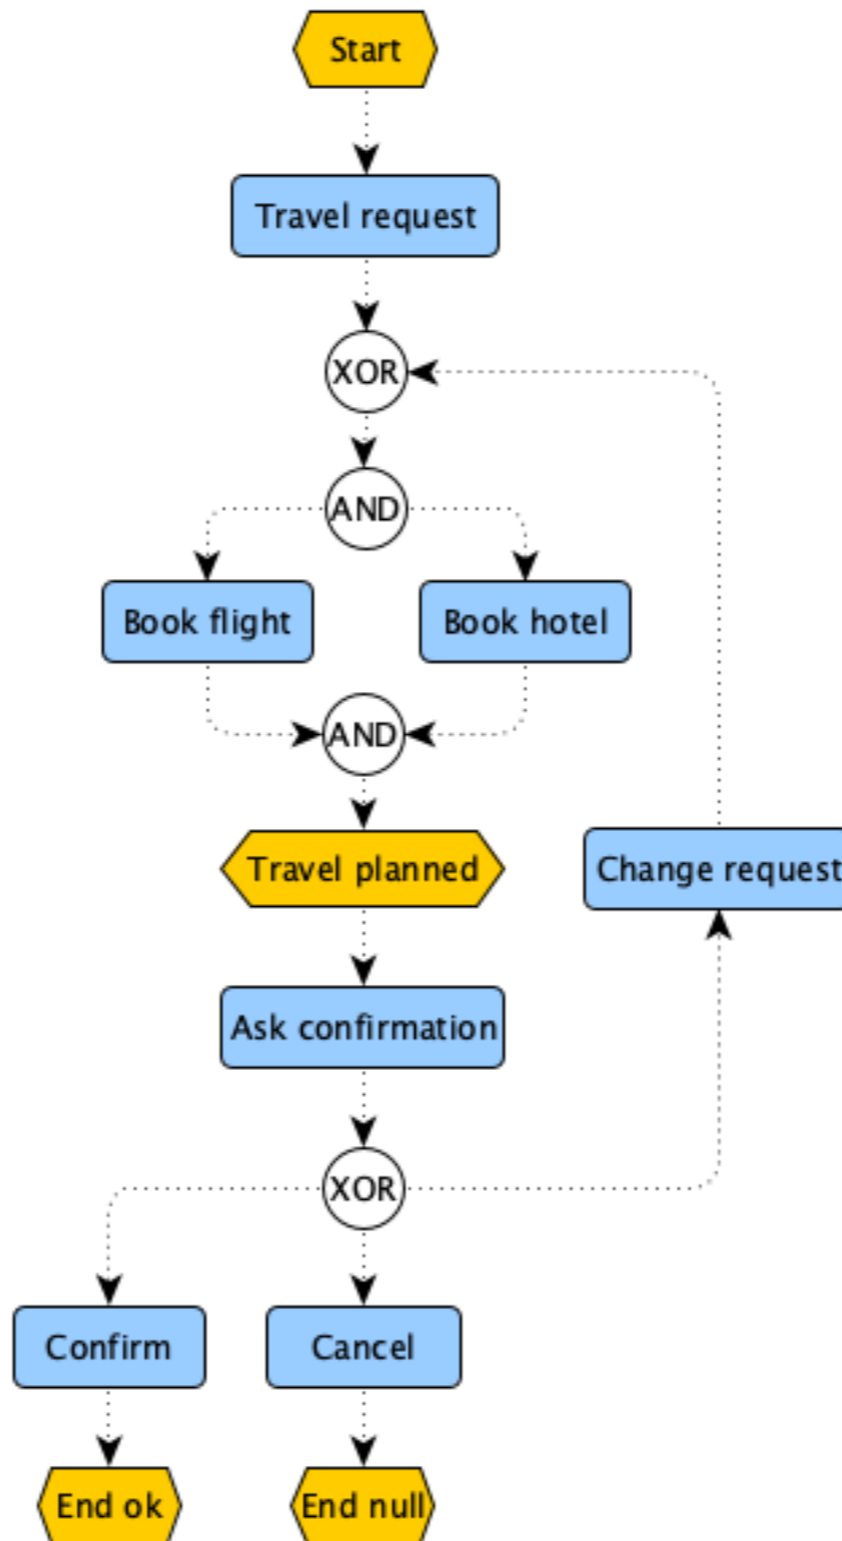

We overview the main challenges that arise when analysing EPC diagrams with Petri nets

EPC Diagrams

EPC ingredients at a glance

EPC: Example

EPC Semantics

Sound EPC diagrams

We exploit the formal semantics of nets to give unambiguous semantics to EPC diagrams

We transform EPC diagrams to Workflow nets:
the EPC diagram is sound if its net is so

We can reuse the verification tools to check if the net is sound

Is there a unique way to proceed? Not necessarily!

Translation of EPC to Petri nets

The idea

From EPC to wf nets in three steps

Step 1
convert each
- event
- function
- connector
to a net fragment

Step 2
connect
fragments
together

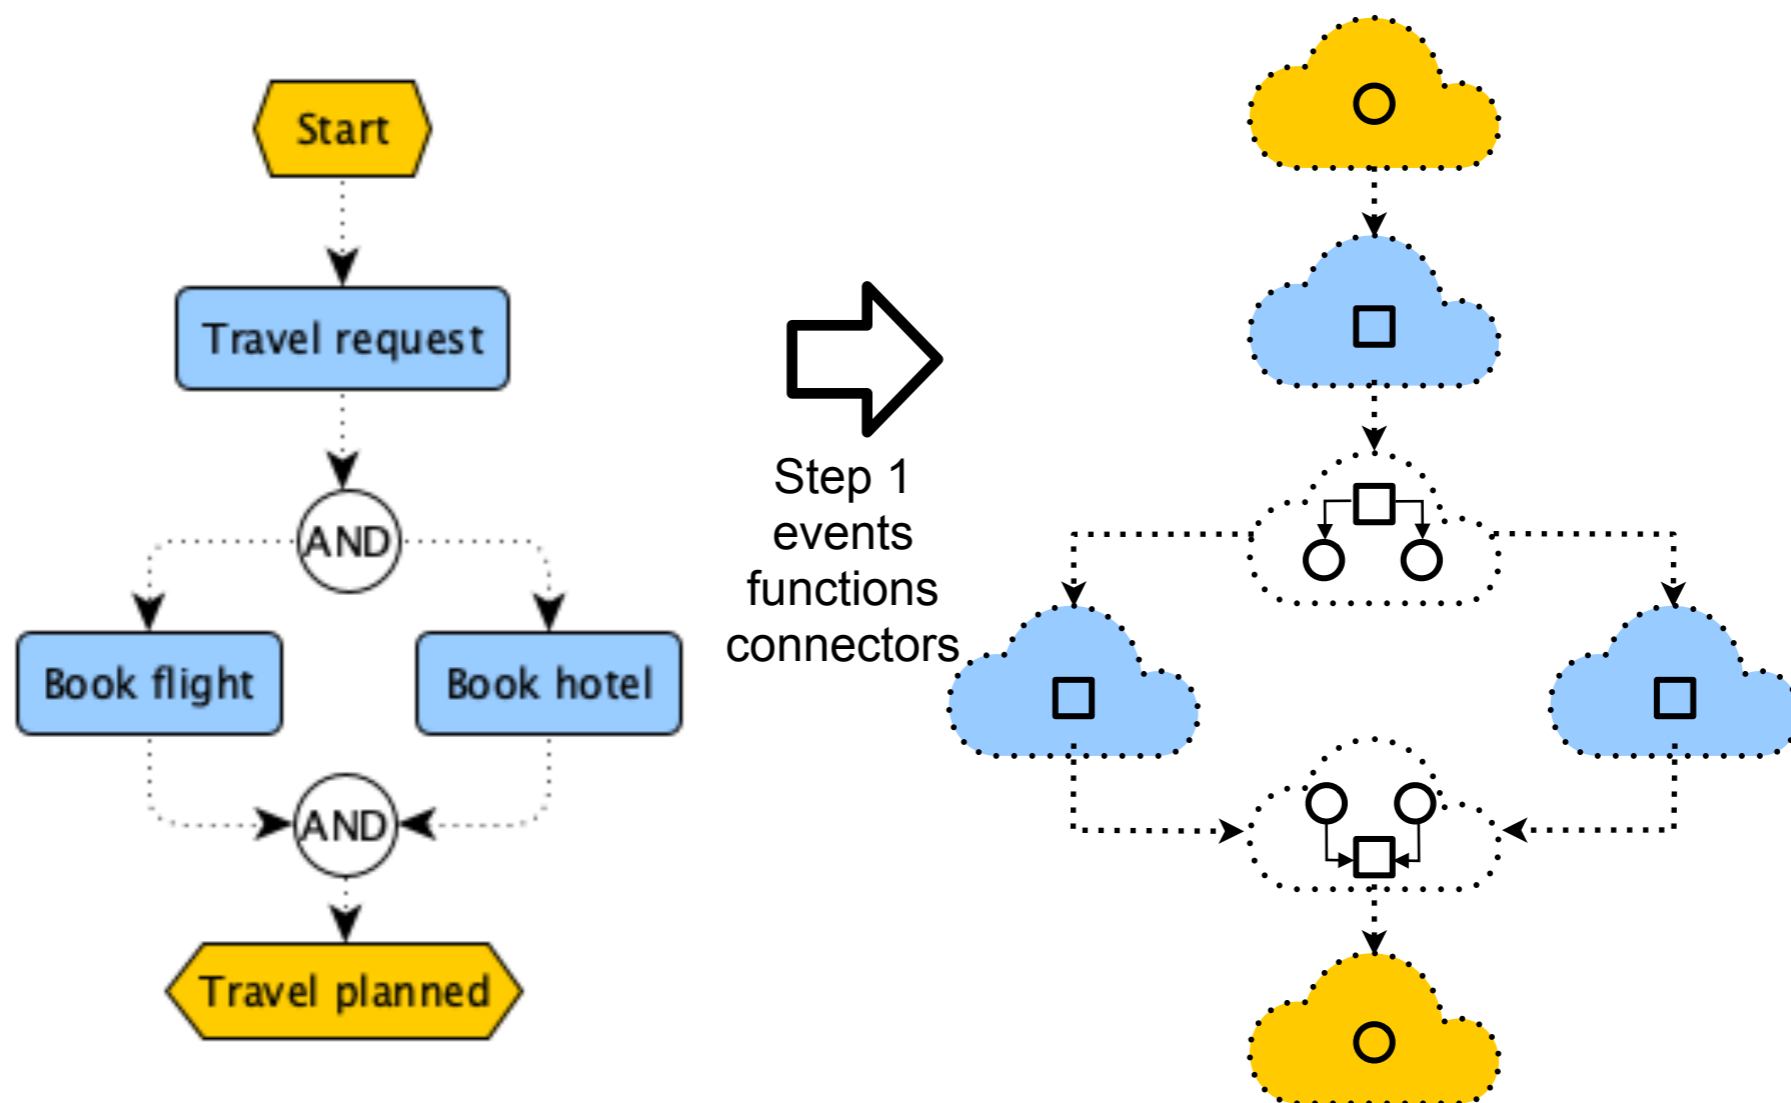

Step 3
enforce
initial place
final place

Step 1

We replace each event, function and connector separately with small net fragments

Step 2: dummy style

Then we connect the fragments together
(we may decide to introduce **dummy places / transitions**)

Step 2: fusion style

Then we connect the fragments together
(or we may decide to merge **places / transitions**)

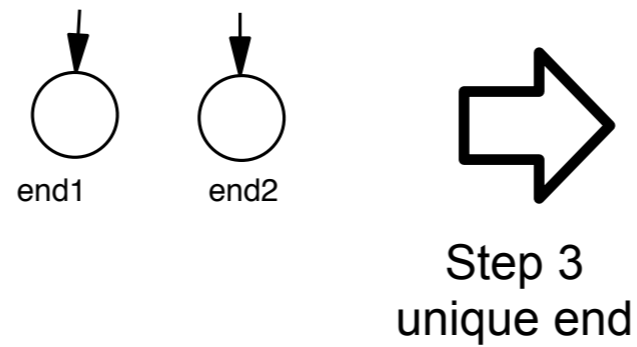

Step 3: unique start

XOR start

Step 3: unique end

OR end

(sometimes XOR/AND can be preferred)

Three approaches

We overview **three** different translations

| n. | ingenuity | style | applicability | outcome |
|-----|---------------------------------|---------|--|--|
| 1st | easy | fusion | any EPC | likely unsound, (relaxed soundness) |
| 2nd | medium, context dependent | (dummy) | simplified EPC: event function alternation, no OR connectors | free-choice net |
| 3rd | hard, context dependent | dummy | decorated EPC: join-split correspondence, OR policies | accurate analysis |

Relaxed Soundness of Business Processes

Juliane Dehnert^{1,*} and Peter Rittgen²

dehnert@cs.tu-berlin.de

² Institute of Business Informatics, University Koblenz-Landau, Germany
rittgen@uni-koblenz.de

Rationale

EPC success is due to its **simplicity**

EPC diagrams lack a consistent semantics:
ambiguous and flawed process descriptions
can arise in the **design phase**

it is important to find out **flaws** as **soon** as possible

therefore

we need to fix a **formal representation**
that **preserves all ambiguities**

Step 1: AND split

EPC element

net fragment

Step 1: AND join

EPC element

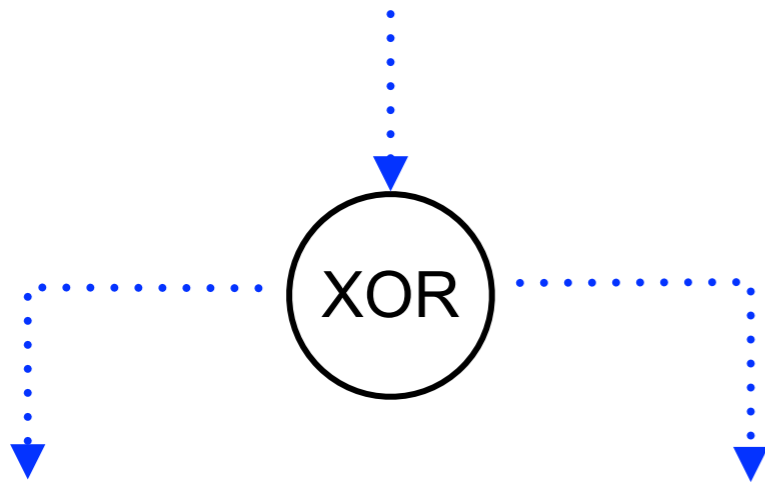

net fragment

Step 1: XOR split

EPC element

+ ad hoc flow?

Soundness analysis

Soundness analysis

Sound, but...
we have repaired the wf net,
not the original EPC diagram!

Soundness analysis

The diagram is now
more complex
and **less readable**
than the original one!

**Are we sure that its translation
is the same sound wf net that
we have designed ad hoc?**

Are we sure it is sound?

Need to restart the analysis!!

Relaxed Soundness (optional reading)

Problem

EPC is widely adopted
also at early stages of design

WF nets offer a useful tool

but

Soundness can be too demanding at early stages

(Un)sound behaviours

A **sound** behaviour:
we move from a start event to an end event
so that nothing blocks or remains undone

The language of the net
collects all and only
its sound behaviours

$$L(N) = \{ \sigma \mid i \xrightarrow{\sigma} o \}$$

Execution paths leading to **unsound** behaviours
can be used to infer potential mistakes

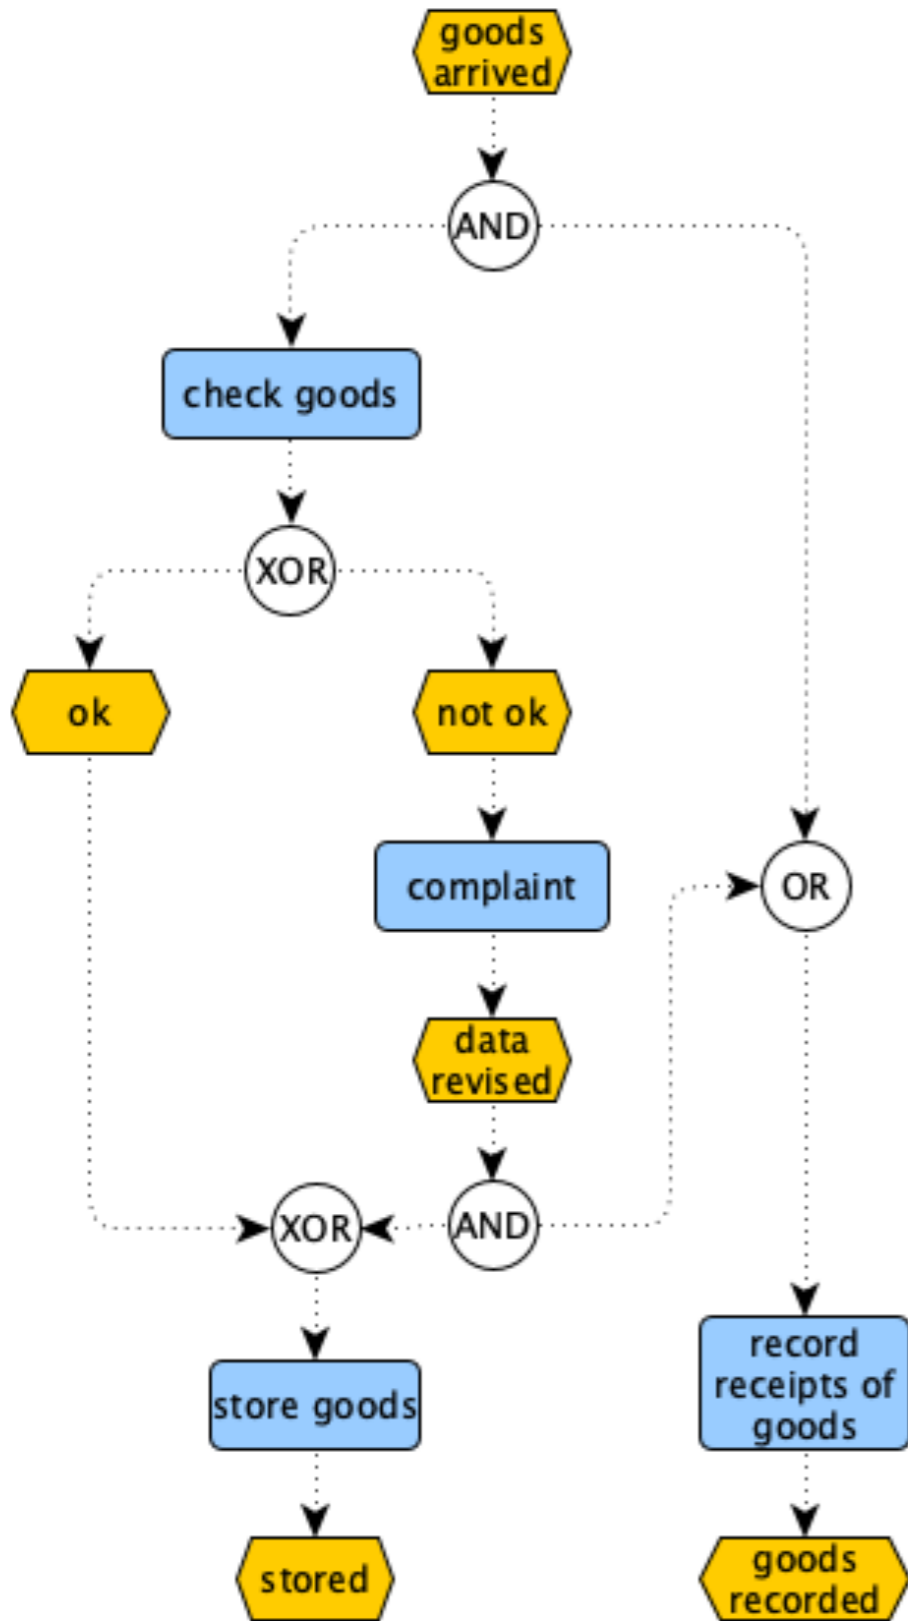

Relaxed soundness

If some unsound behaviour is possible but any transition can take part to one sound execution, then the process is called **relaxed sound**

Definition: A WF net is **relaxed sound** if every transition belongs to a firing sequence that starts in state i and ends in state o (i.e. it appears in the language of the net)

$$\forall t \in T. \exists \sigma \in L(N). \vec{\sigma}(t) > 0$$

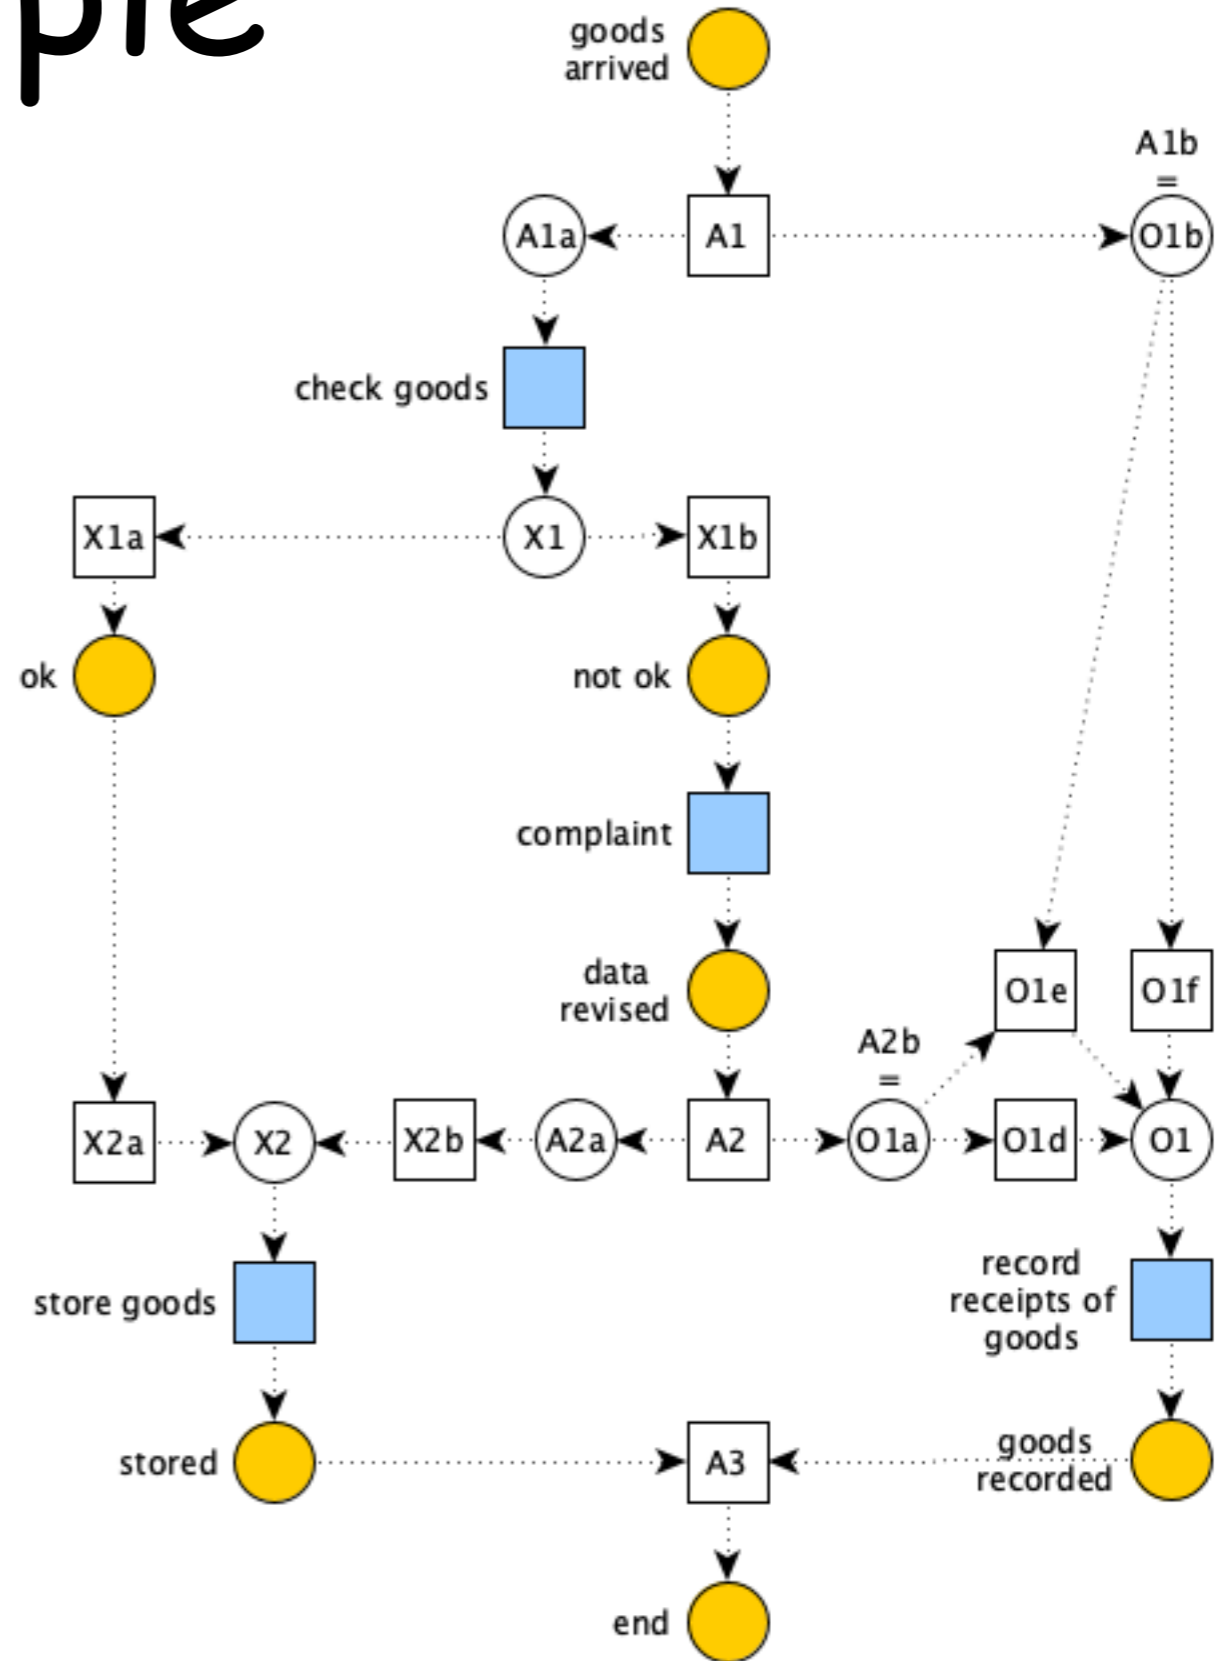

Example

Not
relaxed
sound
as a net!

Steps
1+2+3

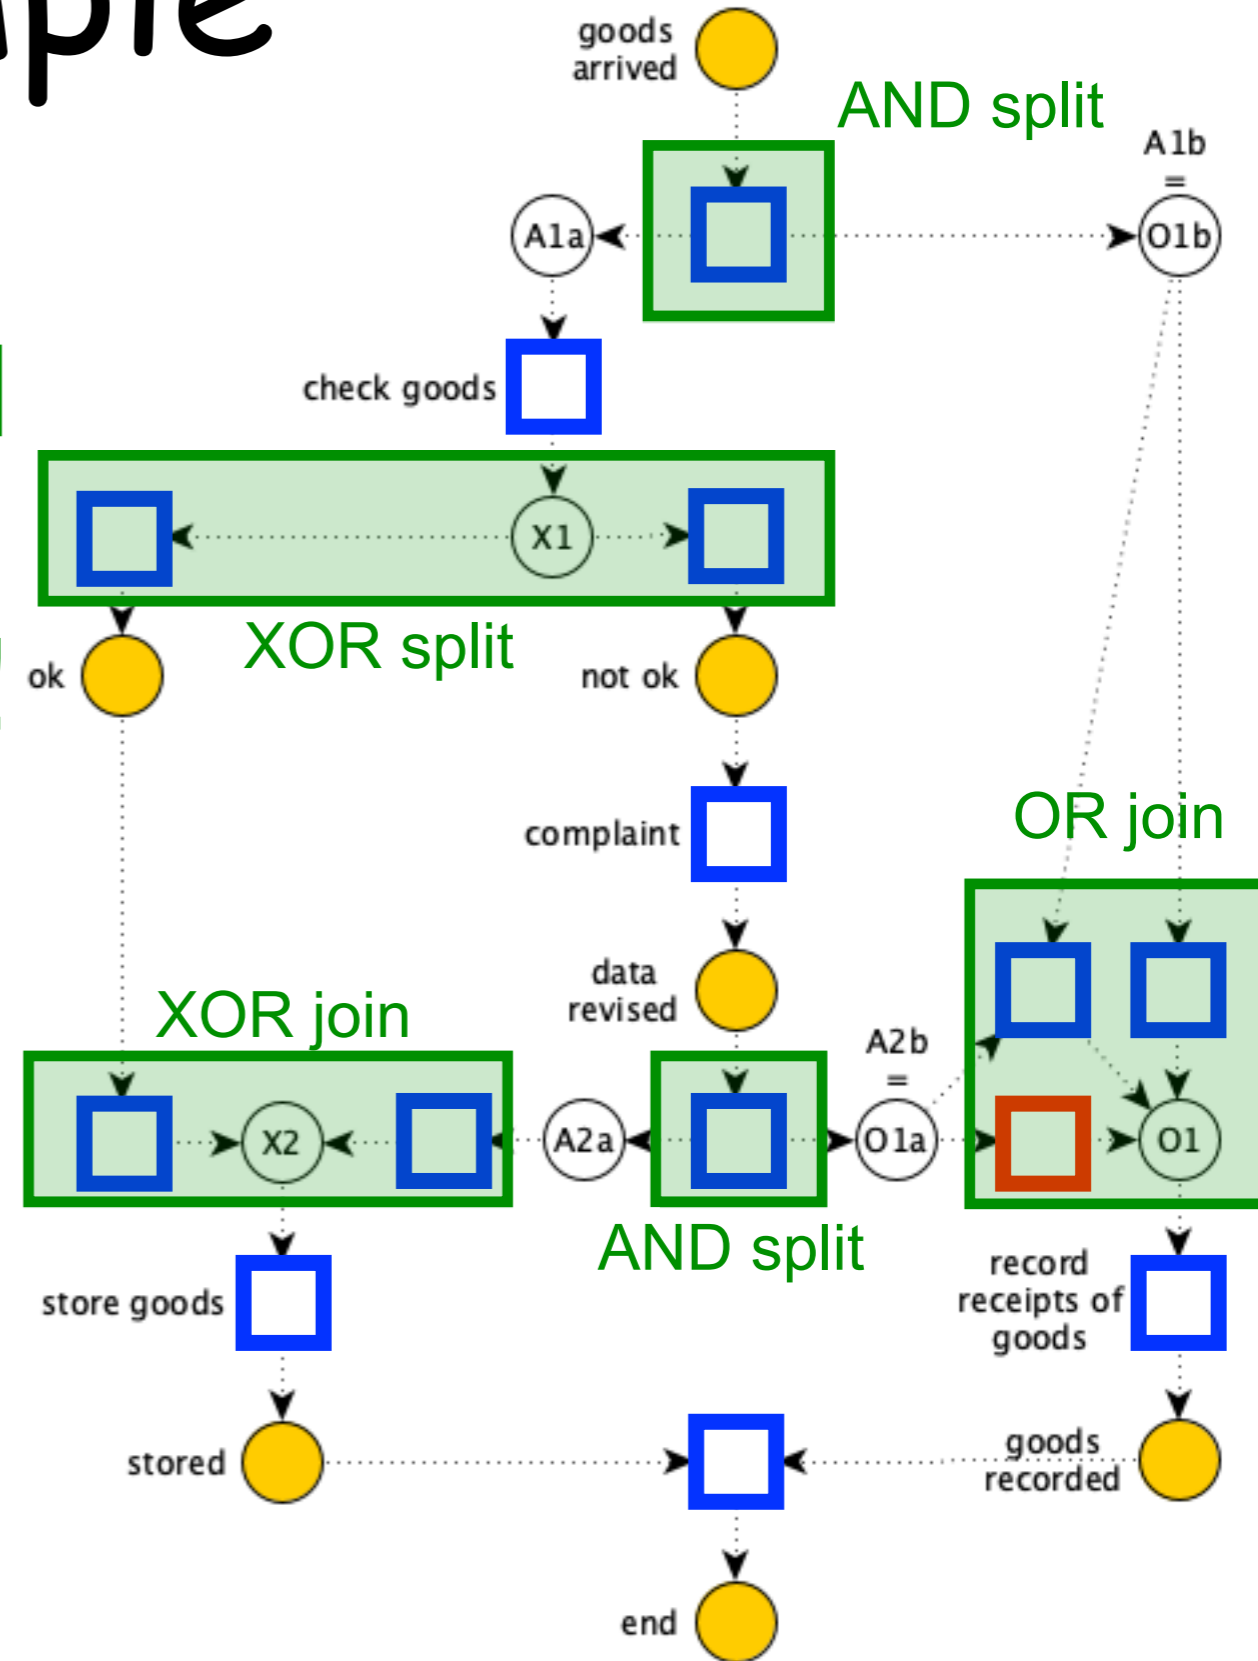

all EPC nodes involved in some sound execution

Example

Relaxed sound as EPC!

Steps 1+2+3

Relaxed soundness?

If the WF net is **not relaxed sound** there are transitions that are not involved in sound executions (not included in a firing sequence of $L(N)$)

Their EPC counterparts may need improvements

Relaxed soundness can be proven only by enumeration (of enough firing sequences of $L(N)$)

Open problem

No equivalent characterization is known that is more convenient to check

Second attempt (no OR connectors)

Formalization and Verification of Event-driven Process Chains

Simplified EPC

We restrict the analysis to a sub-class of EPC diagrams

We require:

event / function alternation

(also along paths between two connectors)

(fusion not needed, dummy places/transitions not needed)

OR-connectors are not present

(avoid intrinsic problems with OR join)

OR-connectors
are not present
alternation
is not satisfied

Example

Add dummy events
and functions
to force alternation

Step 0

Example

Step 1
events and
functions

Step 1: split/join connectors

The translation of logical connectors
depends on the context:

if a connector connects **functions to events**
we apply a certain translation

if it connects **events to functions**
we apply a different translation

Step 1: split/join connectors

The translation of logical connectors
depends on the context:

if a connector connects **transitions to places**
we apply a certain translation

if it connects **places to transitions**
we apply a different translation

Step 1: AND split

MODIFIED EPCs AND THEIR
FORMAL SEMANTICS

Decorated EPC

Applicable to any EPC diagram, provided that its designer add some information

We require:

every (X)OR join is paired with a corresponding split
(possibly of the same type)

OR-joins are decorated with a policy
(avoid OR join ambiguous behaviour)

Step 1: AND split

EPC element

net fragment

Step 1: XOR split

EPC element

net fragment

Step 1: OR split

EPC element

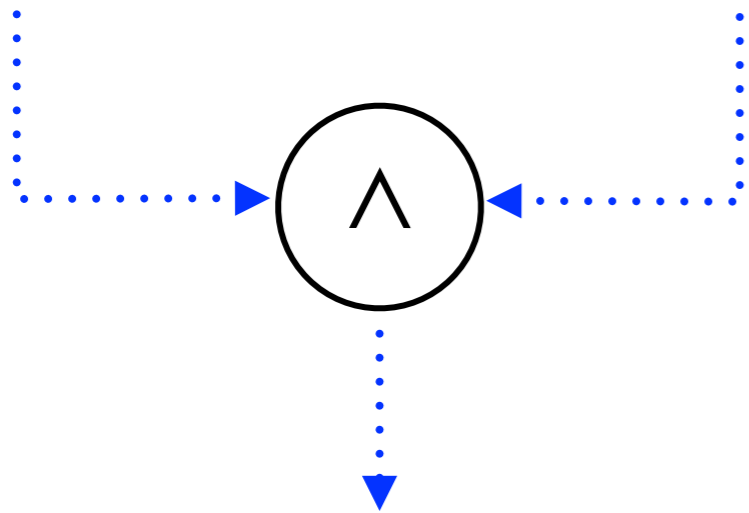

net fragment

Step 1: AND join

EPC element

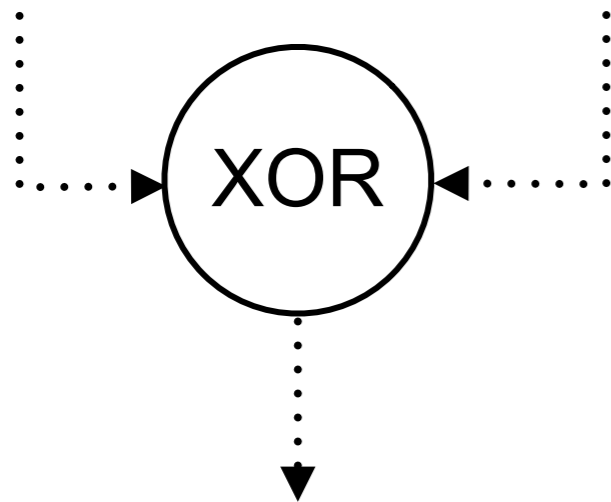

net fragment

XOR join: intended meaning

**if both inputs arrive,
it should block the flow**

**if one input arrives,
it cannot proceed unless
it is informed that
the other input will never arrive**

OR join: intended meaning

if only one input arrives,
it should release the flow

if both inputs arrive,
it should release only one output

if one input arrives,
it must wait until the other arrives or
it is guaranteed that the other will never arrive

OR join: assumption

If an OR join has a **matching split**, its semantics is **wait-for-all**: wait for the completion of all *activated* paths

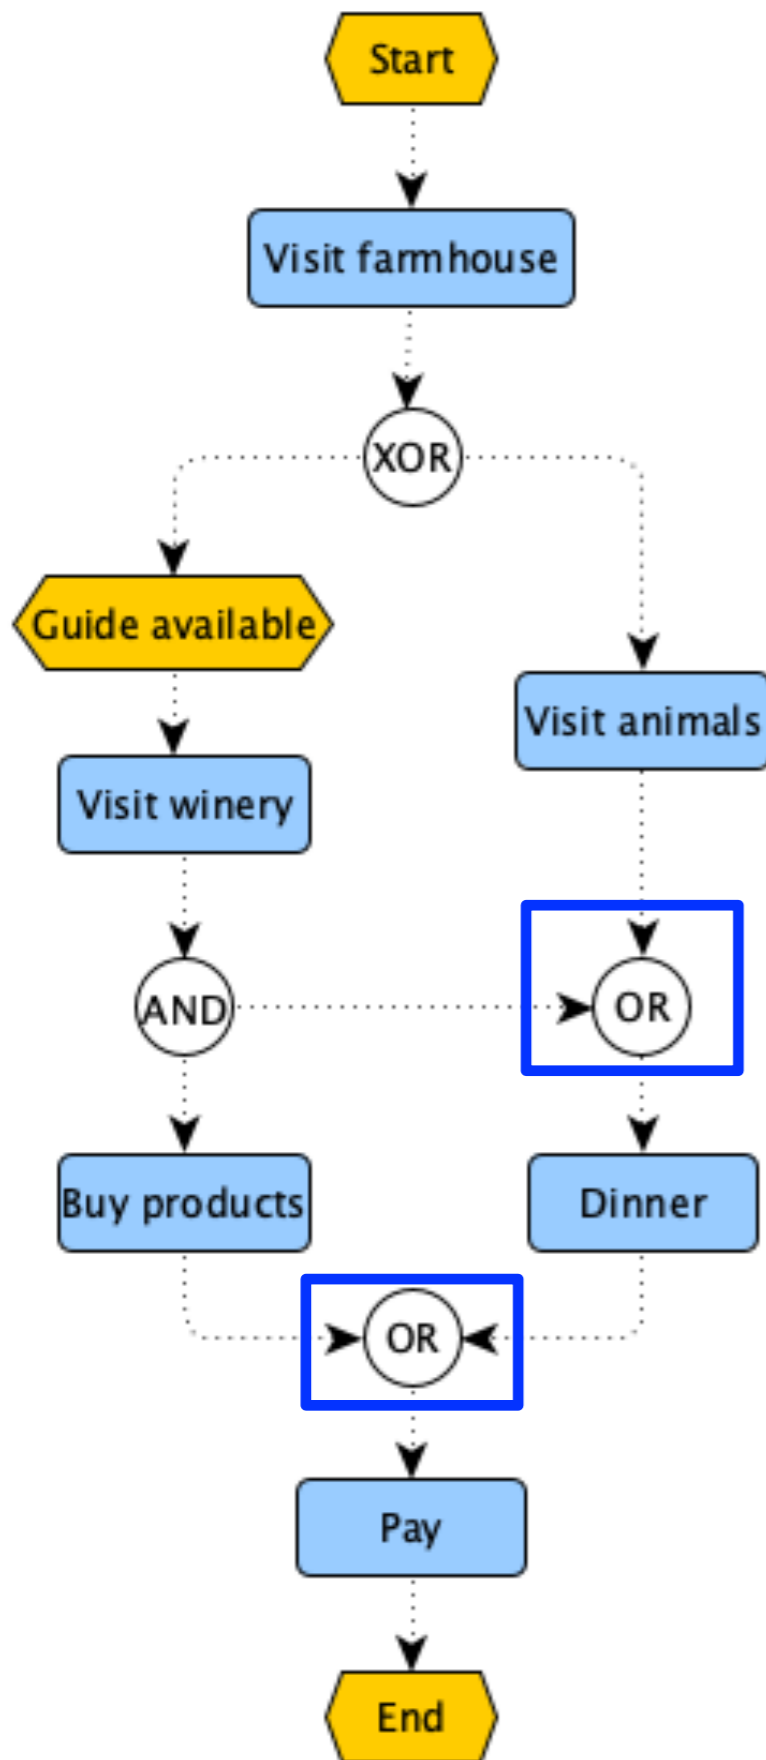

Otherwise, also other policies can be chosen:

every-time: trigger the outgoing path on each input

first-come: wait for the first input and ignore the second

Assumption: every OR join is tagged with a policy (some suggested to have different trapezoid symbols)

Example

two OR joins
but no OR split

Example

only one
candidate split

Example

two candidate splits

Example

assign corresponding splits

Example

fc assign policies

wfa

Assumption

...

An OR join with **matching split uses wfa**

If an OR join has non-matching corresponding split
it is decorated with a policy (wfa, fc, et)

wfa: wait-for-all
works well with any corresponding split

...

Step 1: OR join (wfa)

EPC element

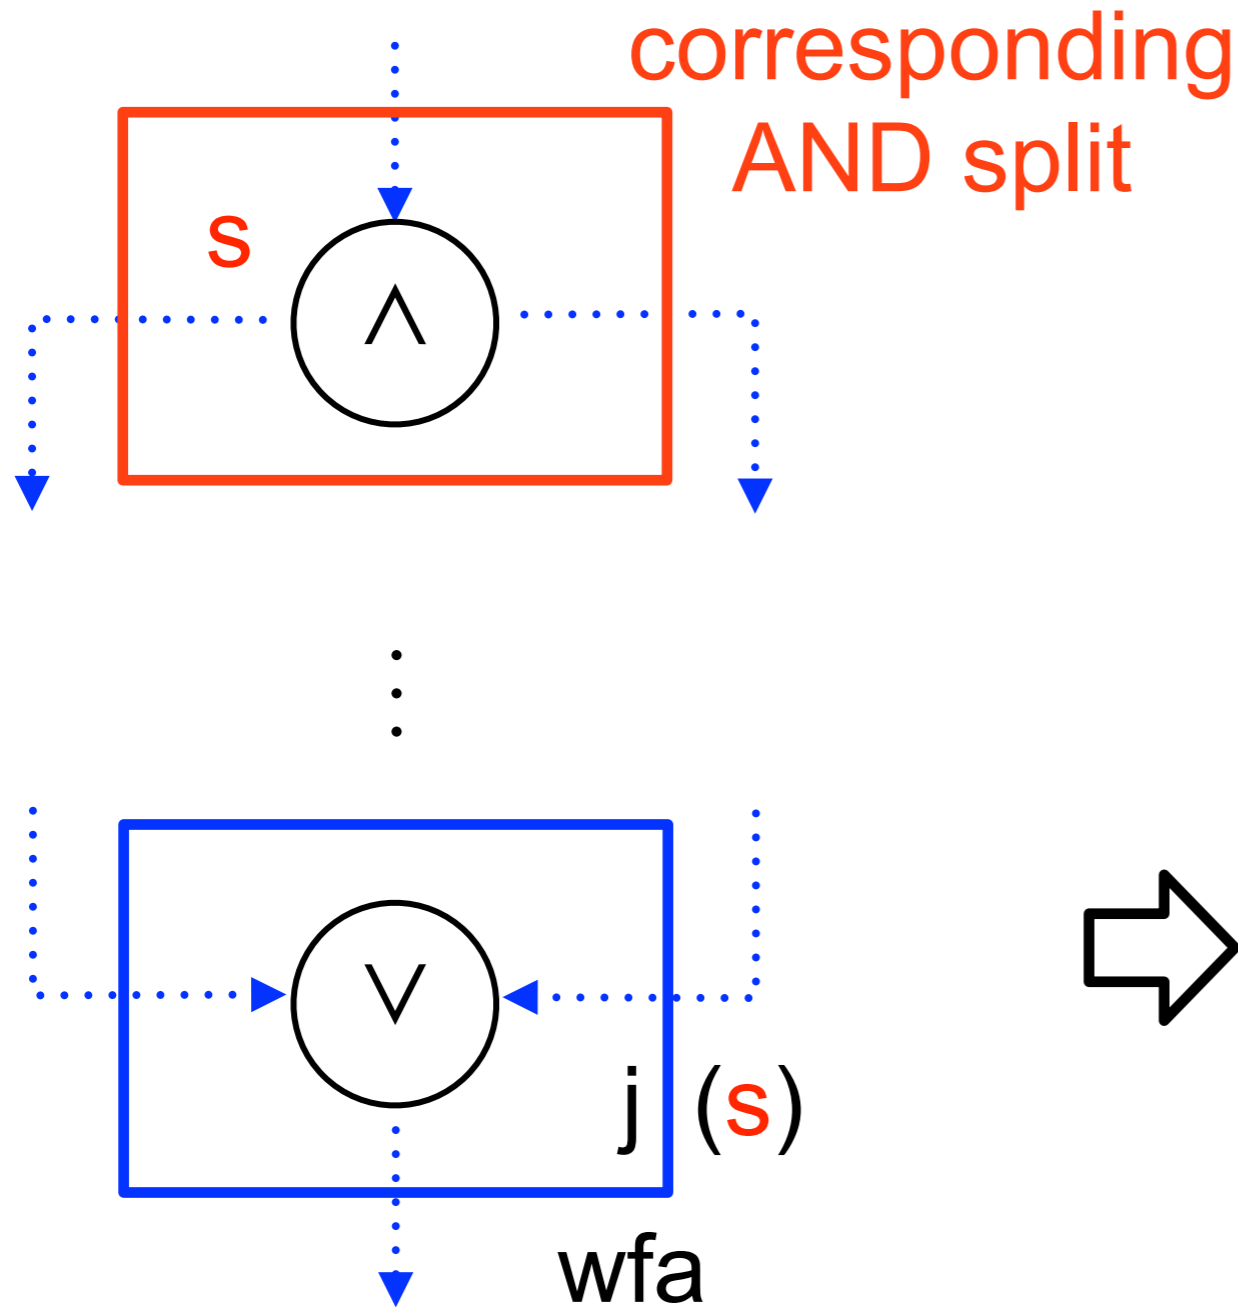

net fragment

Step 1: OR join (wfa)

EPC element

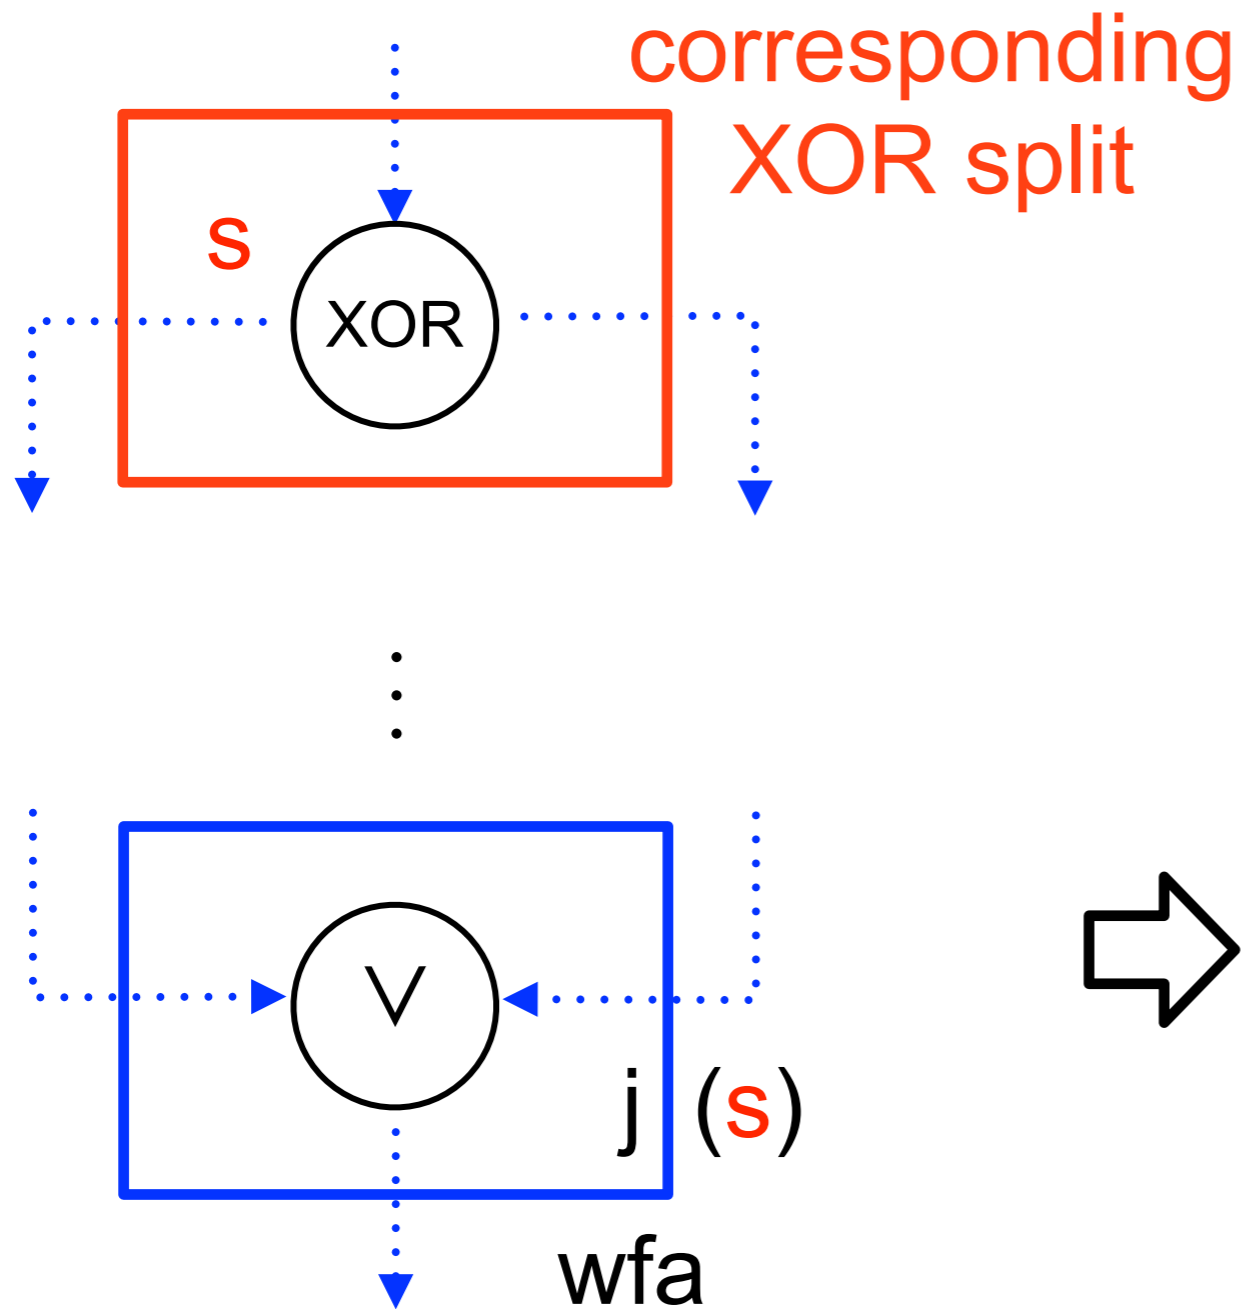

net fragment

Step 1: OR join (wfa)

EPC element

net fragment

Assumption

...

If an OR join has non-matching corresponding split
it is decorated with a policy (wfa, fc, et)

et: every-time

works well with corresponding XOR split

...

Step 1: OR join (et)

EPC element

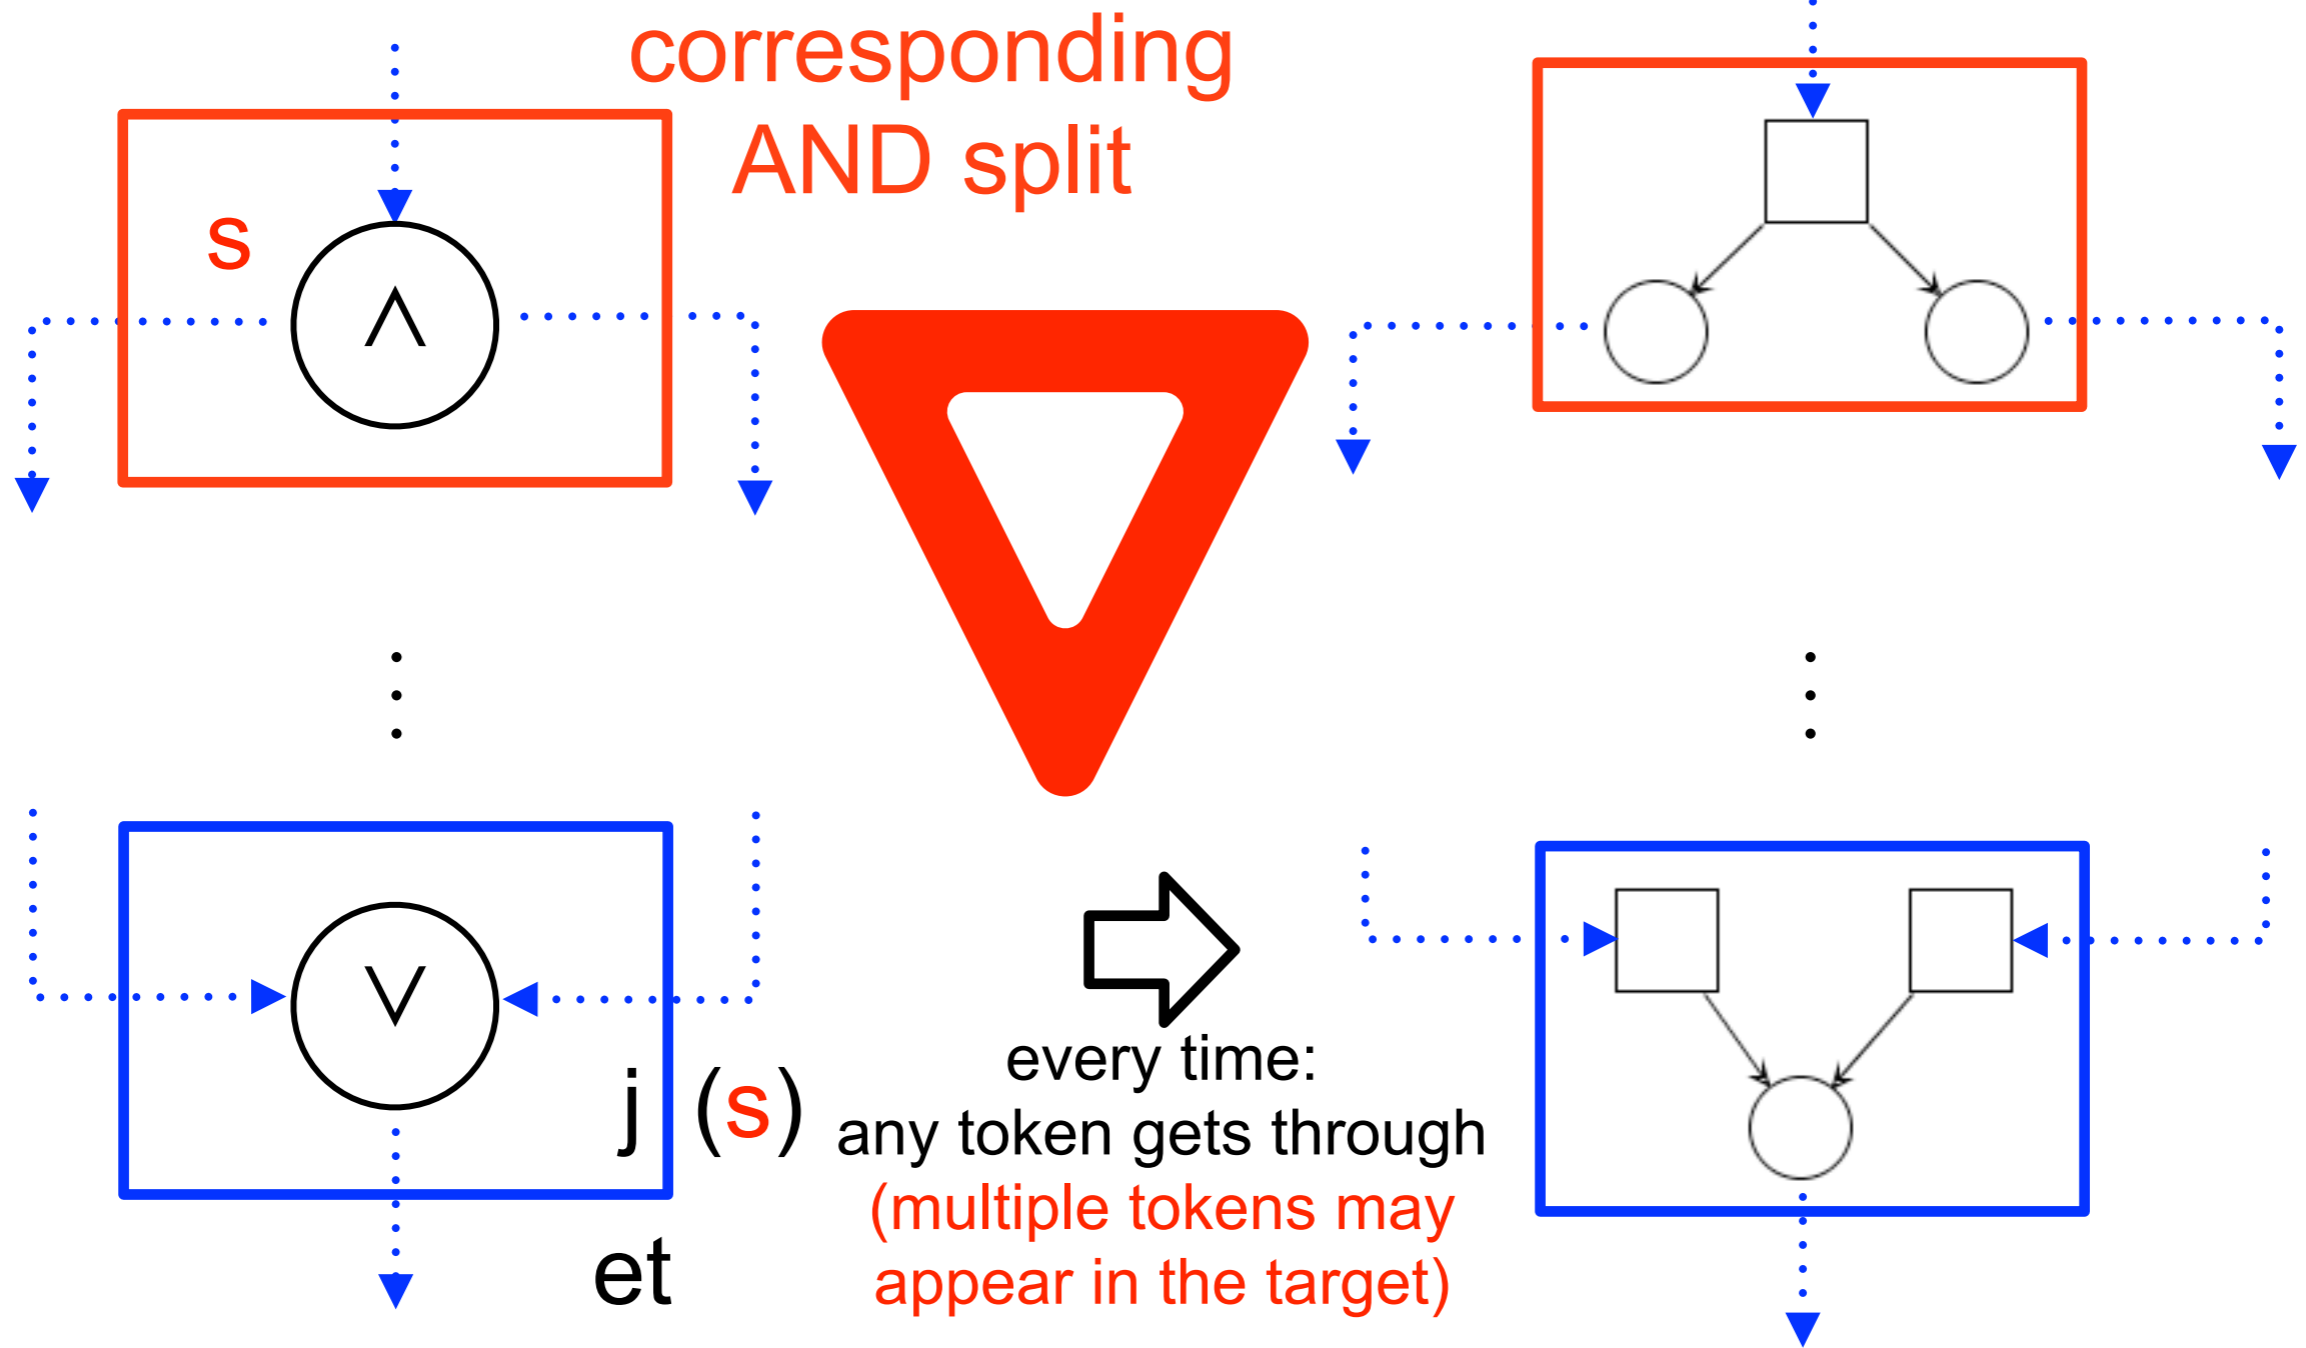

net fragment

Step 1: OR join (et)

EPC element

net fragment

Assumption

...

If an OR join has non-matching corresponding split
it is decorated with a policy (wfa, fc, et)

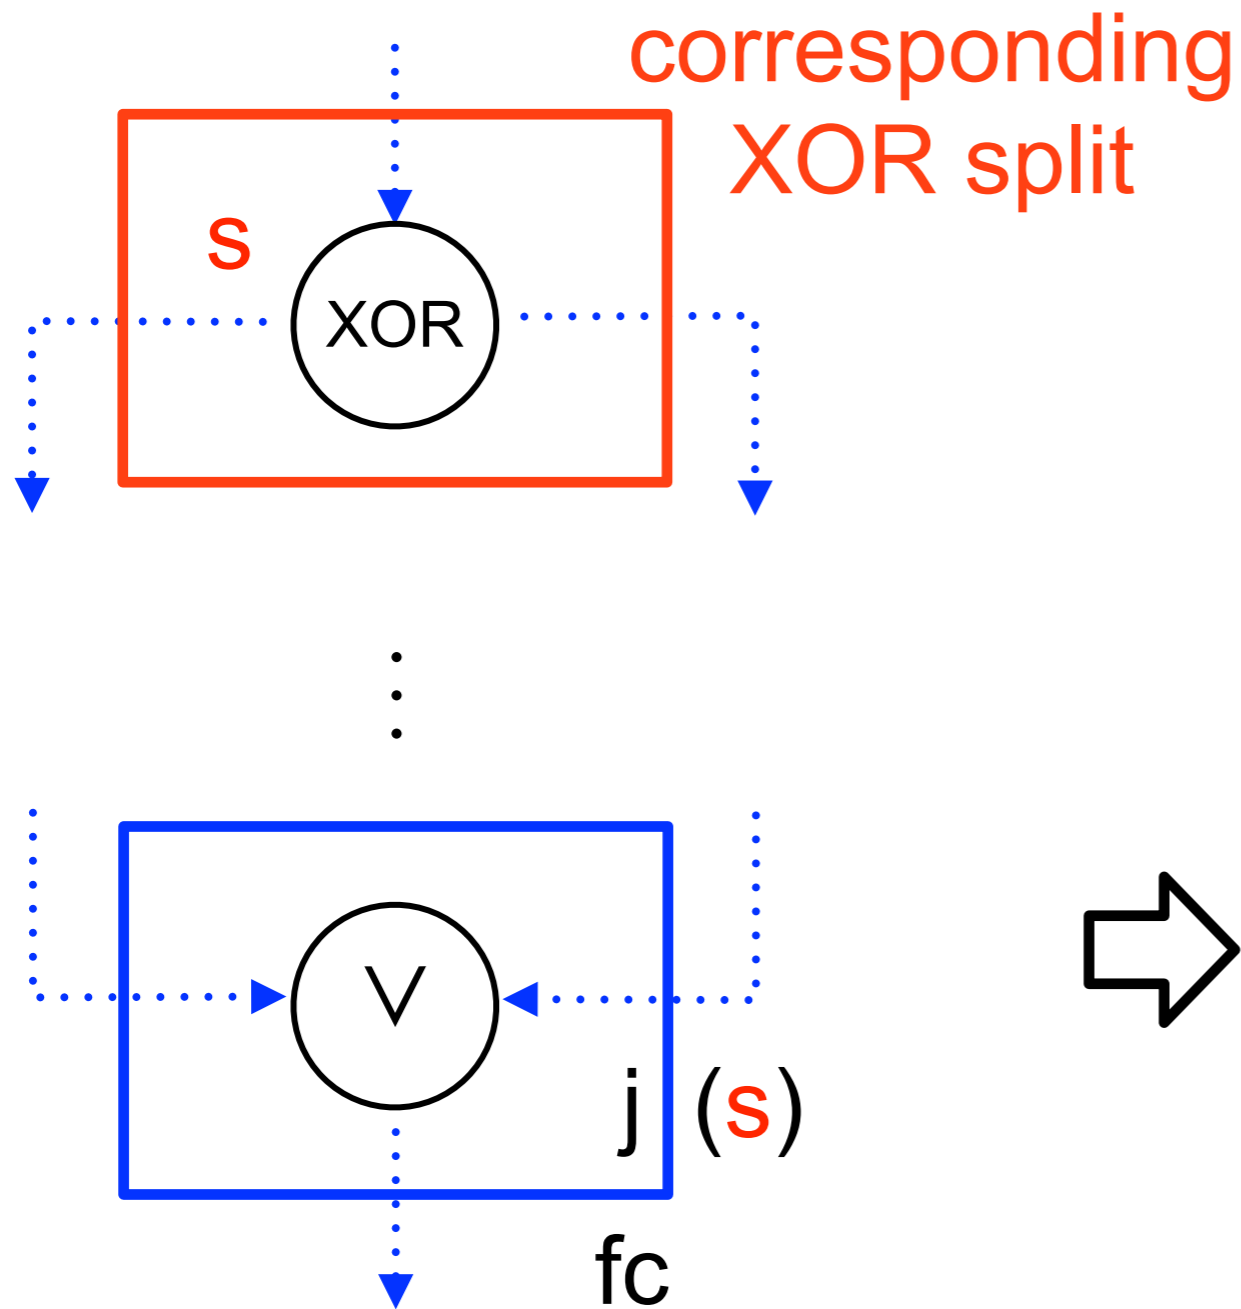

fc: first-come

works well with corresponding XOR split

...

Step 1: OR join (fc)

EPC element

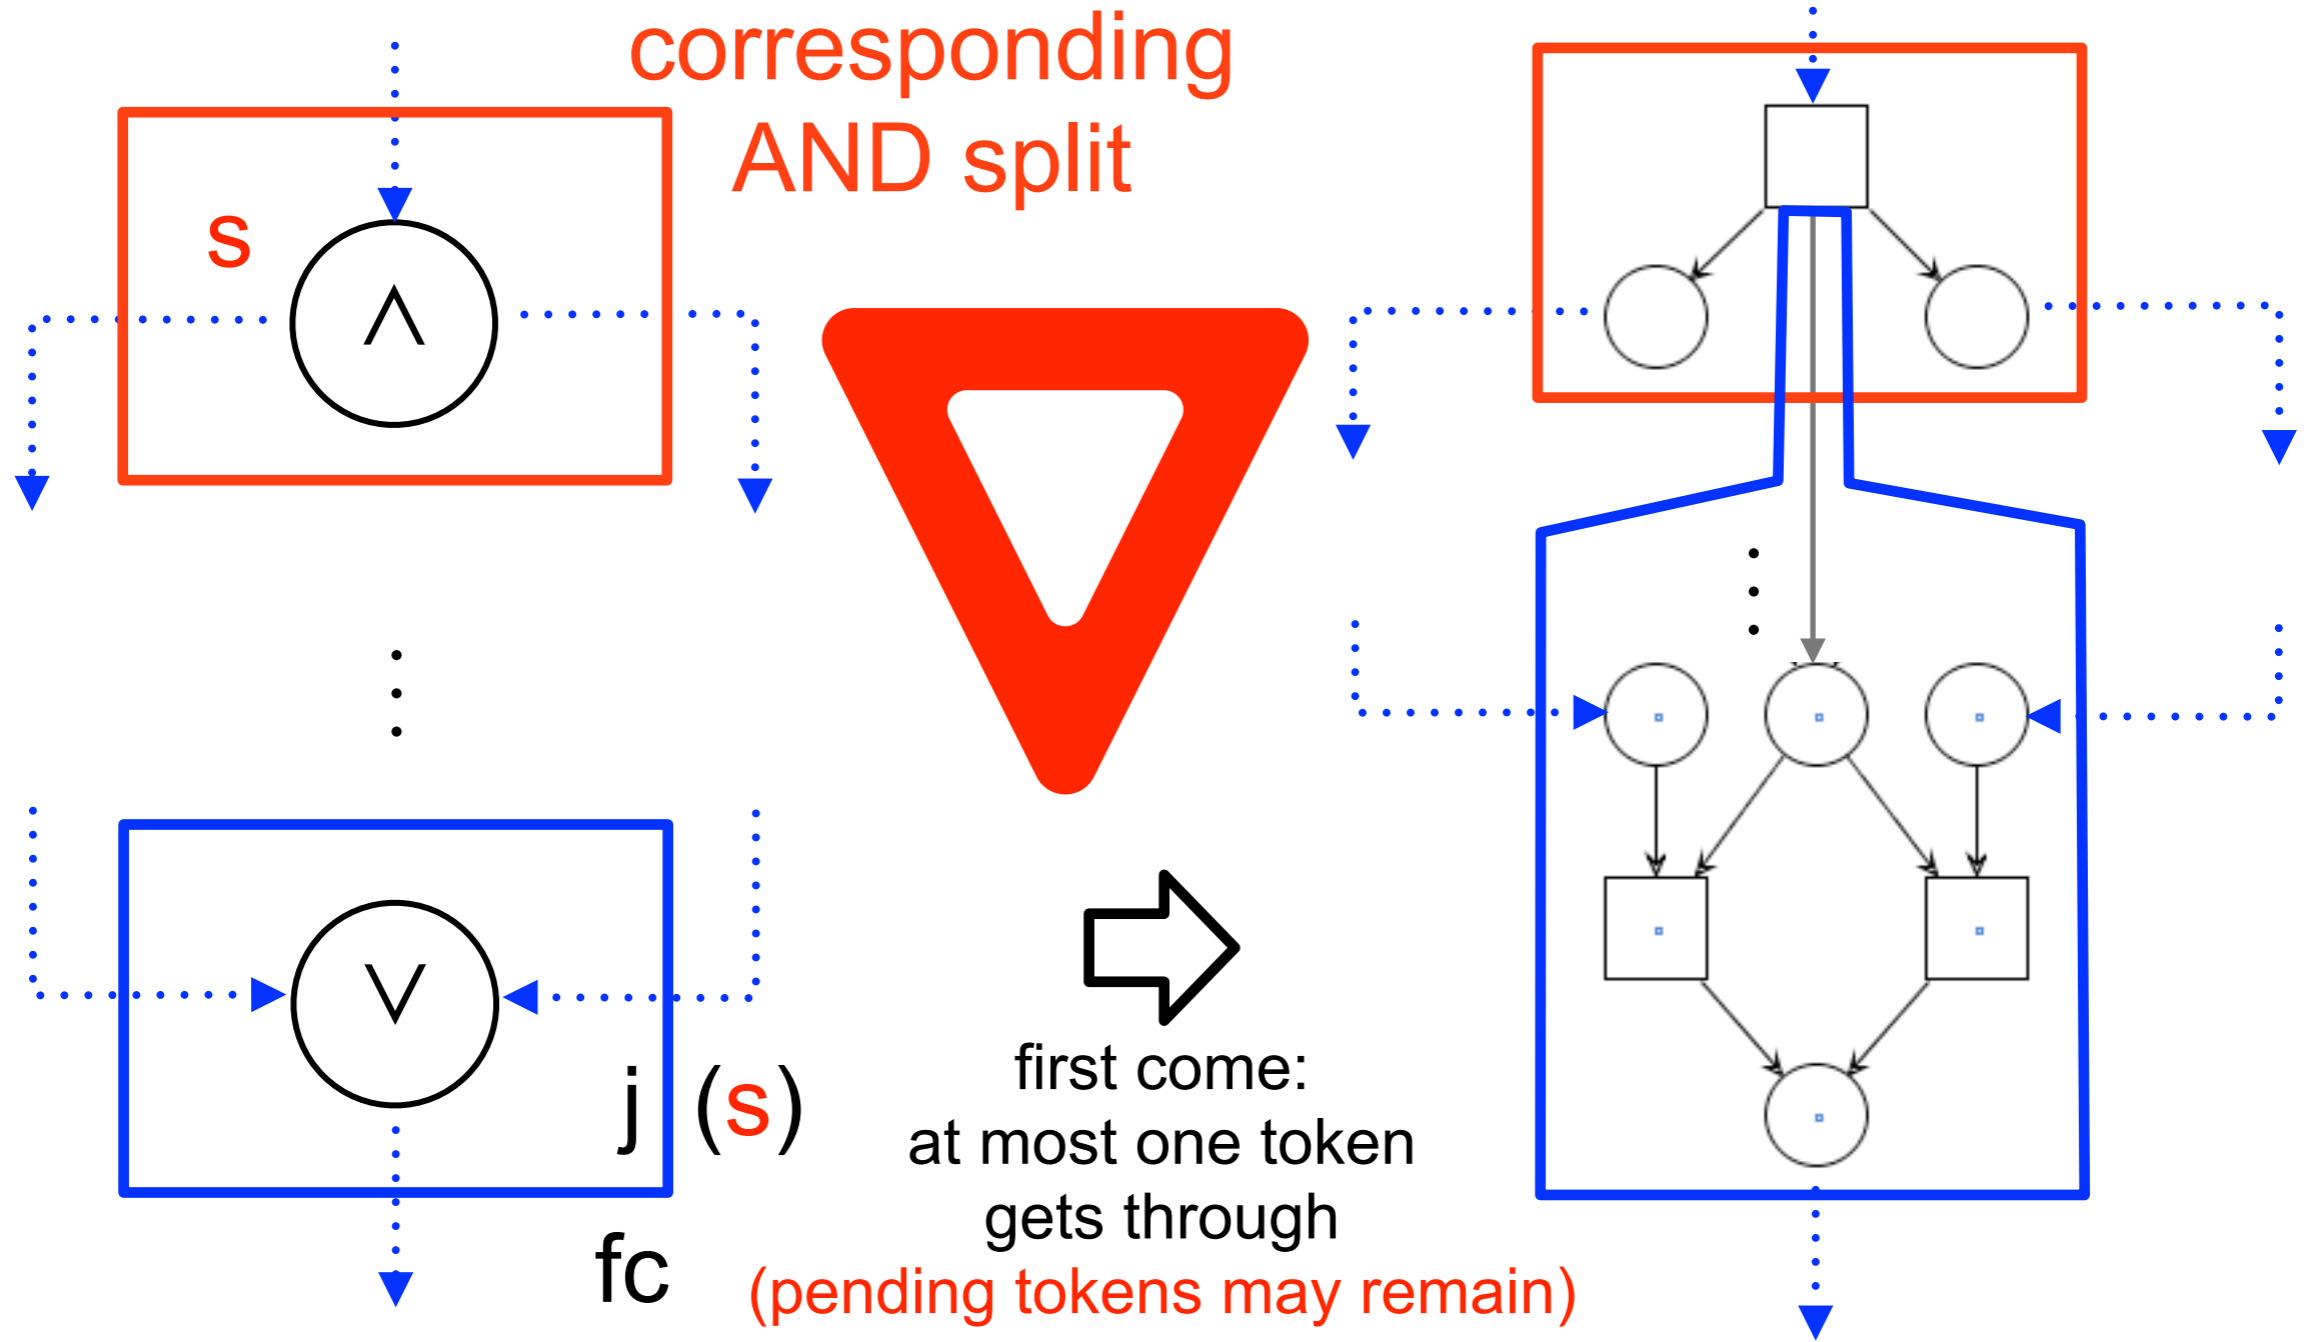

net fragment

Step 1: OR join (fc)

EPC element

net fragment

XOR join: assumption

If a XOR join has a **matching split**, the semantics is:
“it blocks if both paths are activated and
it is triggered by a unique activated path”

Any policy (wait-for-all, first-come, every-time)

contradicts the exclusivity of XOR

(a token from one path can be accepted only if we make
sure that no second token will arrive via the other path)

Assumption: every XOR join has a matching split
(the implicit start split is allowed as a valid match)

Assumption

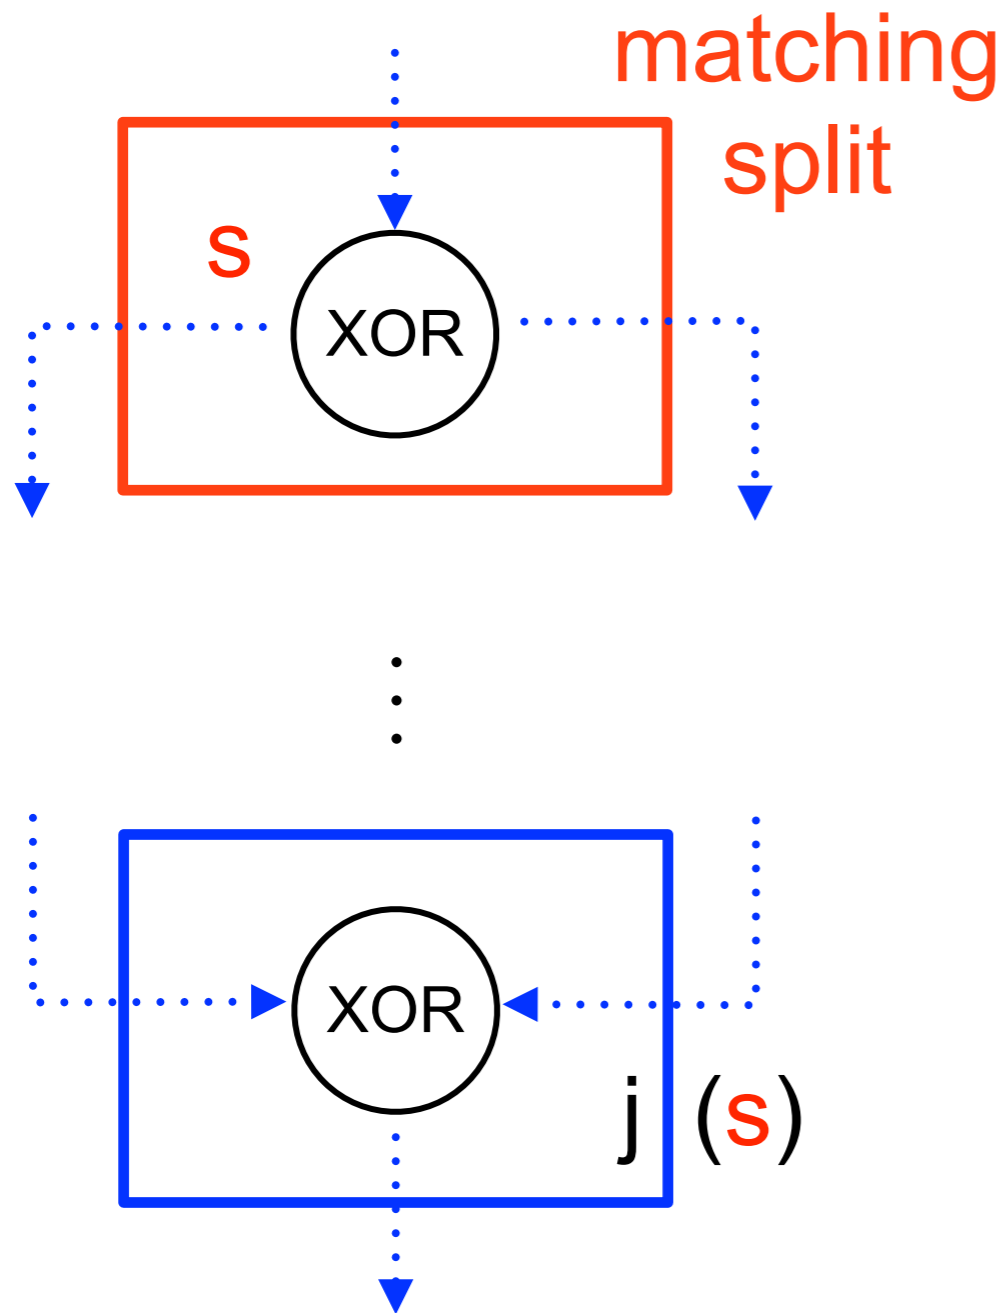

...

Any XOR join has a **corresponding matching split**

...

Step 1: XOR join

EPC element

net fragment

Step 2: dummy style

Step 2: dummy style

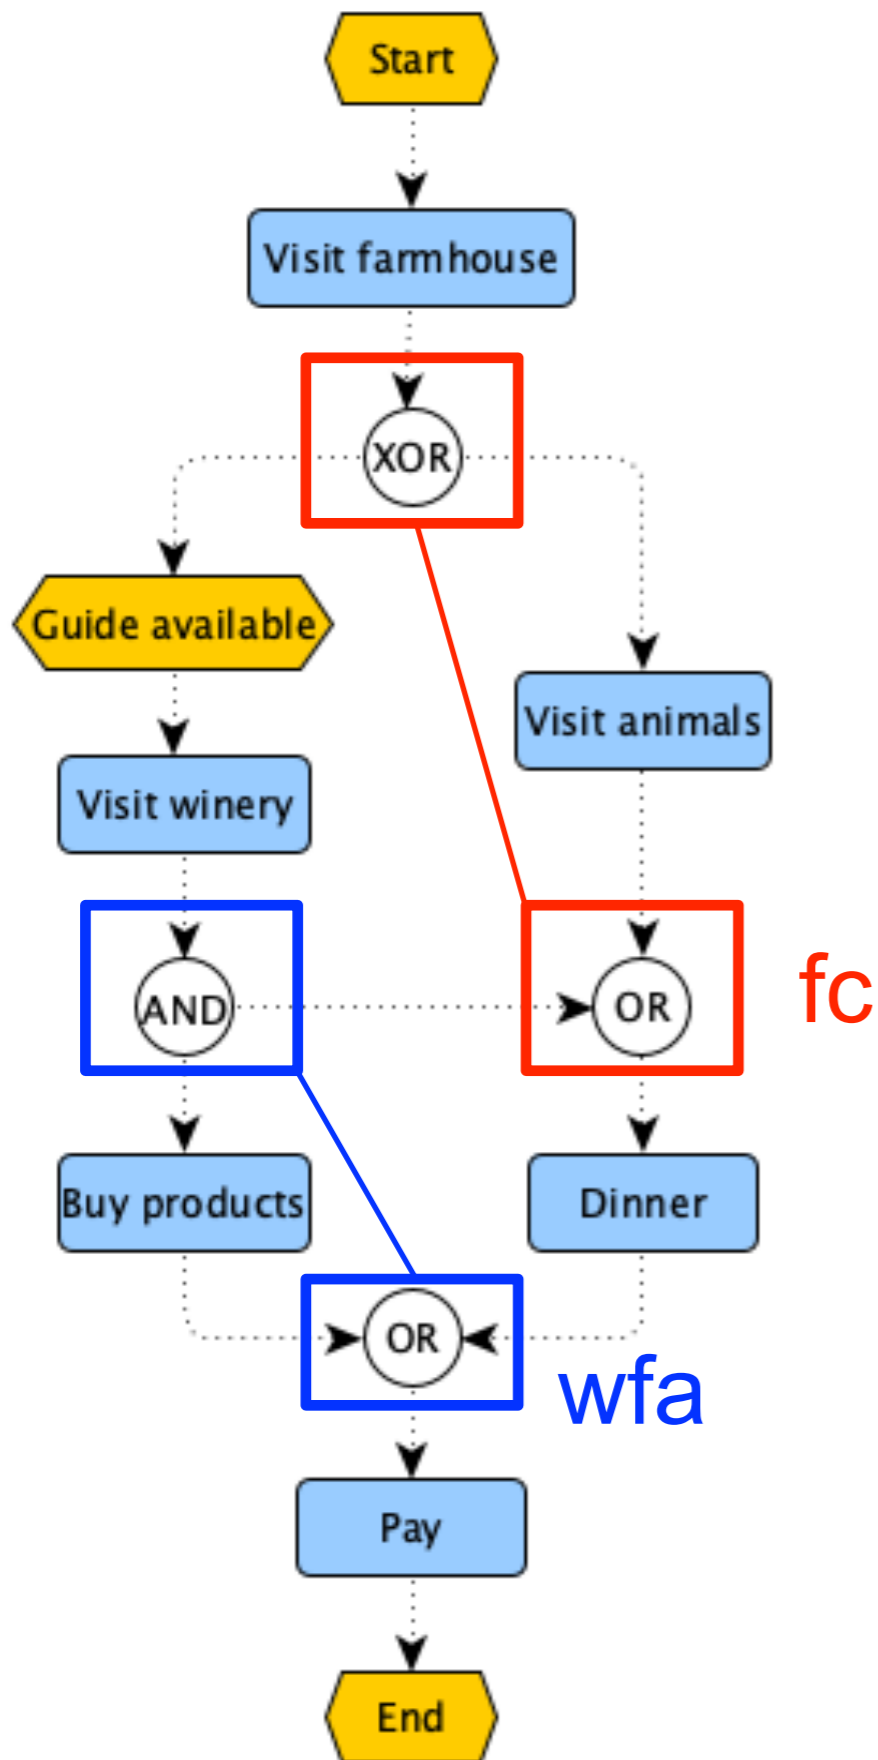

needs a
dummy transition

needs a
dummy place

Example

Not sound!

EPC pros and cons

You may **leave complete freedom**,
but most diagrams will not be sound

You may **constrain diagrams**,
but people like flexible syntax and ignore guidelines

You may **require to add decorations**,
but people will be lazy or misinterpret policies

Exercise

Is this EPC diagram sound?

Choose one of the three techniques seen and apply it to answer the above question
