Conclusions

## The problem

- Solve a problem using  $n_w$  processing resources
- Obtaining a (close to)  $n_w$  speedup with respect to time spent sequentially

$$s(n) = \frac{T_{seq}}{T_{par}(n)} \quad (\text{speedup})$$

$$\epsilon(n) = \frac{T_{id}}{T_{par}(n)} = \frac{T_{seq}}{n \times T_{par}(n)} \quad (\text{efficiency})$$

$$s(n) = \frac{1}{f + \frac{1-f}{n}} \quad (\text{Amdhal law})$$

mechanisms  
design space

Conclusions

## Group tasks

How can the tasks make up a problem be grouped to simplify the job of managing dependencies?

## Order tasks

Given a way of decomposing a problem into tasks and a way of collecting these tasks into logically related groups, how must these groups of tasks be ordered to satisfy constraints among tasks?

## Data sharing

Given a data and task decomposition for a problem, how is data shared among the tasks?

Structure  
design space

Supporting  
structures  
design space

Implementation  
mechanisms  
design space

Conclusions

## Design evaluation pattern

Is the decomposition and dependency analysis so far good to move on to the next design space, or should the design be revisited?

Forces:

- Suitability for the target platform (PE available, sharing support, coordination of PE activities, overheads)
- Design quality (flexibility, efficiency, simplicity)
- Preparation for the next phase of the design (regularity of the solution, synchronous/asynchronous interactions, task grouping)

Implementation  
mechanisms  
design space

Conclusions

## Pipeline

Suppose that the overall computation involves performing a calculation on many sets of data, where the calculation can be viewed in terms of data flowing through a sequence of stages. How can potential concurrency be exploited ?

## Event based coordination

Suppose th application can be decomposed into groups of semi-independent tasks interacting in an irregular fashion. The interaction is determined by the flow of data between them which implies ordering constraints between the tasks. How can these tasks and their interaction be implemented so they can execute concurrently?

design space

Conclusions

## SPMD (Single Program Multiple Data)

The interactions between the various UEs cause most of the problems when writing correct and efficient parallel programs. How can programmers structure their parallel programs to make these interactions more manageable and easier to integrate with the core computations?

## Master/worker

How should a program be organized when the design is dominated by the need to dynamically balance the work on a set of tasks among the UEs?

# Program structures (2)

Implementation  
mechanisms  
design space

Conclusions

## Loop parallelism

Given a serial program whose runtime is dominated by a set of computationally intensive loops, how can it be translated into a parallel program?

## Fork/join

In some programs the number of concurrent tasks varies as the program executes, and the way these tasks are related prevents the use of simple control structures such as parallel loops. How can a parallel program be constructed around such complicated sets of dynamic tasks?

patterns

Finding  
concurrency  
design space

Algorithm  
Structure  
design space

Supporting  
structures  
design space

Implementation  
mechanisms  
design space

Conclusions

## Shared data

How does one explicitly manage shared data inside a set of concurrent tasks?

## Shared queue

How can concurrently-executing UEs safely share a queue data structure?

## Distributed array

Arrays often need to be partitioned between multiple UEs. How can we do this so the resulting program is both readable and efficient?

# Implementation mechanisms

Parallel design  
patterns

Finding  
concurrency  
design space

Algorithm  
Structure  
design space

Supporting  
structures  
design space

Implementation  
mechanisms  
design space

Conclusions

Directly related to the target architecture:

- 1** to provide mechanisms suitable to create a set of concurrent activities (UE Units of Execution)  
→ threads, processes (creation, destruction)
- 2** to support interactions among the UEs  
→ locks, mutexes, semaphores, memory fences, barriers, monitors, ...
- 3** to support data exchange among the UEs  
→ communication channels, queues, shared memory, collective operations (broadcasts, multicast, barrier, reduce) ...

design space

Conclusions

Sw engineering vs. HPC community

**SwEng** Focus on efficiency of the programming process

**HPC** Focus on performance  
(and programmer productivity)

Then:

**Design patterns** “recipes” to be implemented in order to  
get a working program

**Algorithmic skeletons** predefined program constructs  
(language constructs, classes, library entries)  
implementing parallel patterns

# Typical skeleton based program development

Parallel design patterns

M. Danelutto

Introduction

Parallel design patterns

Finding concurrency design space

Algorithm Structure design space

Supporting structures design space

Implementation mechanisms design space

Conclusions

- 1** Figure out which skeleton (composition) models your problem
- 2** Instantiate skeletons
  - functional parameters (e.g. code, data types) & non functional ones (e.g parallelism degree)
- 3** Fine tune program performance
  - parameter sweeping, bottleneck analysis or skeleton restructuring

→ no parallel debugging, correctness guaranteed

→ no possibility to use parallel patterns not supported by the skeleton set

# Typical algorithmic skeleton frameworks

**Writing programs that scale with increasing numbers of cores should be as easy as writing programs for sequential computers.**

BY KRSTE ASANOVIC, RASTISLAV BODIK, JAMES DEMMEL, TONY KEAVENY, KURT KEUTZER, JOHN KUBIATOWICZ, NELSON MORGAN, DAVID PATTERSON, KOUSHIK SEN, JOHN WAWRZYNEK, DAVID WESSEL, AND KATHERINE YELICK

## A View of the Parallel Computing Landscape

INDUSTRY NEEDS HELP from the research community to succeed in its recent dramatic shift to parallel computing. Failure could jeopardize both the IT industry and the portions of the economy that depend on rapidly improving information technology. Here, we review the issues and, as an example, describe an integrated approach we're developing at the Parallel Computing Laboratory, or Par Lab, to tackle the parallel challenge.

## Principles

- Architecting parallel software with design patterns, not just parallel programming languages
- Split productivity and efficiency layers, not just a single general-purpose layer
- Generating code with search-based autotuners, not compilers
- Synthesis with sketching
- Verification and testing, not one or the other
- ...

Conclusions

Intel® Threading Building Blocks Design Patterns

## 7 Divide and Conquer

---

### Problem

Parallelize a divide and conquer algorithm.

### Context

Divide and conquer is widely used in serial algorithms. Common examples are quicksort and mergesort.

### Forces

- Problem can be transformed into subproblems that can be solved independently.
- Splitting problem or merging solutions is relatively cheap compared to cost of solving the subproblems.

### Solution

There are several ways to implement divide and conquer in Intel®Threading Building Blocks (Intel® TBB). The best choice depends upon circumstances.

- If division always yields the same number of subproblems, use recursion and `tbb::parallel_invoke`.
- If the number of subproblems varies, use recursion and `tbb::task_group`.
- If ultimate efficiency and scalability is important, use `tbb::task` and continuation passing style.

# Sample TBB pattern: D&C

patterns

Finding  
concurrency  
design space

Algorithm  
Structure  
design space

Supporting  
structures  
design space

Implementation  
mechanisms  
design space

Conclusions

## Example

The number of subsorts is fixed at two, so `tbb::parallel_invoke` provides a simple way to parallelize it. The parallel code is shown below:

```
void ParallelQuicksort( T* begin, T* end ) {  
    if( end-begin>1 ) {  
        using namespace std;  
        T* mid = partition( begin+1, end, bind2nd(less<T>(),*begin) );  
        swap( *begin, mid[-1] );  
        tbb::parallel_invoke( [=]{ParallelQuicksort( begin, mid-1 );},  
                             [=]{ParallelQuicksort( mid, end );} );  
    }  
}
```
